I Siebel 8.1.x Business Automation: Course Introduction

Lesson Agenda	I-2
Instructor and Class Participants	I-3
Training Site Information	I-4
Course Audience	I-5
Course Prerequisites	I-6
Course Goal	I-7
Course Objectives	I-8
Course Methodology	I-9
Course Materials	I-10
Siebel Documentation	I-11
Feedback	I-12
Course Agenda	I-13
Summary	I-16
Practice 0 Overview: Preparing the Classroom Environment	I-17

1 Siebel Business Services

Objectives	1-2
Automating Business Processes	1-3
Siebel Automation Facilities	1-4
Business Service	1-5
Prebuilt Business Services	1-6
Repository-Stored Business Services	1-7
Client-Stored Business Services	1-8
Methods	1-9
Identifying Methods for a Business Service	1-10
Identifying Arguments and Types for a Method	1-11
Invoking a Method	1-12
Property Set	1-13
Testing a Business Service	1-15
Lesson Highlights	1-17
Practice 1 Overview: Simulating a Business Service	1-18

2 Building Siebel Workflow Processes

Objectives 2-2

Workflow Process 2-3

Workflow Designer 2-4

Workflow Process Steps 2-5

Common Workflow Process Steps 2-6

Siebel Operation Step 2-7

Business Service Step 2-8

Decision Point Step 2-9

Process Properties 2-10

Configuring a Siebel Workflow 2-12

1. Create a New Workflow Process 2-13

2. Specify Process Properties 2-14

3. Add Workflow Steps 2-15

4. Configure Workflow Steps: Siebel Operation 2-16

4. Configure Workflow Steps: Business Service 2-17

4. Configure Workflow Steps: Business Service Specify Input and Outputs 2-18

4. Configure the Steps: Decision Point Step 2-19

4. Configure the Steps: Decision Point Step

Set Condition 2-20

5. Validate the Workflow Process 2-21

Additional Workflow Steps 2-22

Workflow Modes 2-23

Lesson Highlights 2-24

Practice 2 Overview: Building Workflow Processes 2-25

2a Siebel Workflow Practices

Two Workflow Processes 2a-2

AUT Create Contact Identifier: Functional Requirement 2a-3

AUT Create Contact Identifier: Implementation 2a-4

AUT Big Opportunity: Functional Requirement 2a-5

AUT Big Opportunity: Implementation 2a-6

Outbound Communications Manager Business Service 2a-7

Sending Email in a Workflow Process 2a-8

Communications Drivers and Profiles 2a-9

Communications Templates 2a-10

3 Testing and Deploying Workflow Processes

Objectives 3-2

Managing Siebel Workflow Processes 3-3

Workflow Simulator 3-4

Enabling Workflow Simulation	3-5
Testing a Workflow Using the Workflow Simulator	3-6
1. Specify the Test Records	3-7
2. Start the Simulator	3-8
3. Start the Simulation	3-9
4. Execute the Workflow	3-10
4. Execute the Workflow: Using the Watch Window	3-11
4. Execute the Workflow: Completing the Simulation	3-12
Workflow Simulator Considerations	3-13
Deploying Workflow Processes	3-14
Developer: Publish the Workflow	3-15
Developer: Check In the Workflow Process	3-16
Administrator: Activate the Workflow	3-17
Workflow Publishing and Activation: Summary	3-18
Using Publish/Activate to Speed Workflow Testing	3-19
Deployment Considerations	3-20
Revising Workflows	3-21
Administering a Revised Workflow	3-22
Lesson Highlights	3-23
Practice 3 Overview: Testing Siebel Workflow Processes	3-24

4 Siebel Workflow Architecture

Objectives	4-2
Executing Siebel Workflows	4-3
Invoking a Workflow Process in the Business Service Simulator	4-4
Server Components and the Siebel Workflow Engine	4-5
Application Object Managers (AOMs)	4-6
Workflow Process Manager (WfProcMgr)	4-7
Dispatching Workflow Execution to WfProcMgr	4-8
Workflow Process Batch Manager (WfProcBatchMgr)	4-9
Synchronous versus Asynchronous Execution of Workflows	4-10
Other Workflow Management Server Components	4-11
Enabling Workflow Management Server Components	4-12
Workflow Process Run-Time Environment: Input and Output Arguments	4-13
The Role of a Workflow's Business Object	4-14
Caveats on Business Components	4-15
Workflow Monitoring	4-16
Monitoring Level	4-17
Monitoring Workflow Execution	4-18
Lesson Highlights	4-19
Practice 4 Overview: Exploring Siebel Workflow Architecture	4-20

5 Building Robust Workflows

- Objectives 5-2
- Building Robust Workflows 5-3
- Sub Process Steps 5-4
- Creating a Sub Process: Step Properties 5-5
- Creating a Sub Process: Input and Output Properties 5-6
- Passing Data to a Sub Process by Reference 5-7
- Error Handling 5-8
- Error Process Name Workflow Property 5-9
- Error Exception Connector 5-10
- Stop Step 5-11
- Workflow Behavior on Error Conditions 5-12
- Errors in Sub Processes 5-13
- Querying in Workflow Processes 5-14
- Looping Through a Record Set 5-15
- Query and Looping Example 5-16
- Setting a Search Specification 5-17
- Search Specification Syntax 5-18
- A Restriction on Query Operations 5-19
- Querying the Primary Business Component 5-20
- Lesson Highlights 5-21

6 Invoking Workflow Processes: Runtime Events and Custom Controls

- Objectives 6-2
- Invoking Workflow Processes 6-3
- Run-Time Events 6-4
- Run-Time Events: Object Types 6-5
- Business Component Events 6-6
- Adding a Run-Time Event to a Workflow Process 6-7
- Using a Run-Time Event to Invoke a Workflow 6-8
 - 1. Add the Run-Time Event 6-9
 - 2. Publish and Activate the Workflow 6-10
 - 2. Deploy and Activate the Workflow: Run-Time Events 6-11
 - 3. Reload the Run-Time Events 6-12
- Deactivating a Workflow Invoked by a Runtime Event 6-13
- Invoking Workflows Using a Custom Control 6-14
- Invoking a Workflow Using a Custom Menu Item 6-15
- Invoking a Workflow Using a Custom Button 6-17
- Invoking a Workflow Process Programmatically 6-18

Lesson Highlights 6-19
Practice 6 Overview: Executing Workflow Processes 6-20

7 Using Workflow Policies

Objectives 7-2
Asynchronous Workflow Processing 7-3
Workflow Policies 7-4
Workflow Policy Conditions 7-5
Workflow Policy Actions 7-6
Workflow Process Manager 7-7
Executing Workflow Policies: Overview 7-8
Workflow Policy Groups 7-9
Implementing a Workflow Policy 7-10
1. Create a Workflow Policy Group 7-11
2. Create a Workflow Policy Action 7-12
3. Create a Workflow Policy 7-13
3. Create a Workflow Policy: Set Duration 7-14
4. Generate Database Triggers 7-15
4. Generate Database Triggers: Creating a Job 7-16
5. Start the Workflow Monitor Agent 7-17
Verify the Workflow Policy 7-18
Extending Workflow Policies: The Problem 7-19
Extending Workflow Policies: Example 7-20
Extending Workflow Policies: The Solution 7-21
Workflow Policy Object Types 7-22
Workflow Policy Object Types Example 7-23
Adding a New Policy Condition Field 7-24
1. Identify the Field's Database Table and Column 7-25
2. Create a Workflow Policy Column Definition 7-26
3. Create a Workflow Policy Component Column Definition 7-27
4. Compile and Test Changes 7-28
Lesson Highlights 7-29
Practice 7 Overview: Using Workflow Policies 7-30

8 Configuring the Universal Inbox

Objectives 8-2
The Universal Inbox 8-3
Inbox Types 8-4
Inbox: User Activities 8-5
Inbox: Additional User Views 8-6
Inbox: Administrative Views 8-7

Inbox: Object Types 8-8
Example: Creating Object Types 8-9
Example: Modifying Object Types 8-10
Inbox: Inbound Architecture 8-11
Universal Inbox Business Service Methods 8-12
Inbox: Outbound Architecture 8-14
Configuring the Inbox 8-15
1. Design the Inbox Process Flow 8-16
2.1. Specify the Name and Translations 8-17
2.2. Specify the Business Object and Destination View(s) 8-18
2.3. Specify the Action Type 8-19
2.4. Specify the Action 8-20
2.5. Specify the Queue and Expiration Durations 8-21
2.6. Specify the Category, Replication Level, and Other Options 8-22
3. Create a Workflow to Add Items to the Inbox 8-24
4. Create the Workflow to Process Inbox Actions 8-25
5. Test the Inbox 8-26
Lesson Highlights 8-27
Practice 8 Overview: Configuring the Inbox 8-28

9 Using Siebel Data Validation Manager

Objectives 9-2
Data Validation Challenge 9-3
Data Validation Solutions in Siebel Applications 9-4
Siebel Data Validation Manager (DVM) 9-5
Data Validation Manager Business Service 9-6
DVM Administrative Data: Overview 9-7
DVM Execution 9-8
Creating Validation Administrative Data 9-9
1. Create a Data Validation Rule Set 9-10
2. Set Rule Set Options 9-11
3. Create Data Validation Messages 9-12
4. Add Data Validation Rules 9-13
5. Associate Validation Messages with Rules 9-14
6. Add Actions to Rules 9-15
7. Specify Rule Detail 9-16
8. Activate the Rule Set 9-17
Invoking Data Validation Manager 9-18
Input Arguments for the DVM Business Service 9-19
Viewing Validation History 9-20
Importing and Exporting Rule Sets 9-21

DVM Considerations 9-22
Lesson Highlights 9-23
Practice 9 Overview: Using Data Validation Manager 9-24

10 Siebel Task UI

Objectives 10-2
Business Challenge 10-3
Business Solution: Siebel Task UI 10-4
Features of Siebel Task UI 10-5
Using Task UI 10-6
Invoking a Task 10-7
Progressing Through a Task 10-9
Branching in a Task 10-10
Pausing a Task 10-11
Resuming a Task 10-12
Completing a Task 10-13
Invoking Tasks 10-14
Contextual Task 10-15
Visibility of Tasks 10-16
Task Designer 10-17
Task Flow 10-18
Task Flow Steps 10-19
Committing Data to Storage 10-20
Transient Data in Task UI 10-21
Comparison of Task and Standard UI 10-22
Lesson Highlights 10-23
Practice 10 Overview: Siebel Task UI 10-24

11 Creating a Task

Objectives 11-2
Creating a Task 11-3
Task View 11-4
Task Views and Standard Views 11-5
Task Group 11-6
Creating a Task 11-7
1. Create the Task Flow 11-8
Create the Task Flow: Add Task Steps 11-9
2. Create Applets for the Task Views 11-10
3. Configure the Task Views 11-11
4. Bind the Task Views 11-13
5. Configure Additional Steps 11-14

- 5. Configure Additional Steps: Configuring a Siebel Operation Step 11-15
- 6. Assign Chapters 11-16
- 7. Create the Task Group 11-17
- 7. Create the Task Group: Assign Context Business Component 11-18
- 8. Compile the Configured Objects 11-19
- 9. Publish the Task Flow 11-20
- 9. Publish the Task Flow 11-21
- Administering a Task 11-22
 - 1. Activate the Task Flow 11-23
 - 2. Register the Task Flow 11-24
 - 3. Assign Responsibilities 11-25
- Testing the Task 11-26
- Lesson Highlights 11-27
- Practice 11 Overview: Creating a Task 11-28

12 Transient Business Components

- Objectives 12-2
- Transient Data 12-3
- Transient Business Component (TBC) 12-4
- Configuring a Transient Business Component 12-5
- Task Applet 12-6
- Types of Task Applets 12-7
- Uses for a Transient Business Component 12-8
- Branching in a Task 12-9
- Configuring Branching in a Task Using a TBC 12-10
 - 1. Extend the Task Flow 12-11
 - 2. Create a Picklist 12-13
 - 3. Create the Transient Business Component 12-14
 - 4. Create the Task Form Applet 12-16
 - 5. Create the Task View 12-18
 - 6. Configure the Decision Point Step 12-19
 - 6. Configure the Decision Point Step: Compose Conditions 12-20
 - 7. Complete the Configuration 12-21
 - 8. Test the Task 12-22
- Lesson Highlights 12-23
- Practice 12 Overview: Transient Business Components 12-24

13 Additional Task UI Configuration

- Objectives 13-2
- Task Properties 13-3
- System Task Properties 13-4

Configuration Involving Task Properties	13-5
Transient Business Component Data	13-6
Using Transient Business Component Data	13-7
1. Create Additional Task Properties	13-8
2. Assign TBC Data to Task Properties	13-9
3. Assign Task Properties to Input Arguments	13-10
Search Specifications in Tasks	13-11
Task Step Context	13-12
Creating a Search Specification	13-13
Contextual Tasks	13-14
Configuring a Contextual Task	13-15
Resuming Tasks from the Inbox	13-16
Inbox Context Field	13-17
Configuring an Instance Identifier	13-18
Subtask	13-19
Characteristics of Subtasks	13-20
Configuring a Subtask	13-21
Adding a Subtask Step	13-22
Task Debugger	13-23
Enabling the Task Debugger	13-24
Using the Task Debugger	13-25
Examining Task Properties	13-26
Examining Business Component Fields	13-27
Lesson Highlights	13-28
Practice 13 Overview: Additional Task UI Configuration	13-29

14 Introducing Scripting

Objectives	14-2
Siebel Scripting	14-3
Integrated Environment	14-4
Script Languages	14-5
Server Scripts	14-6
Server Script Usage	14-7
Browser Scripts	14-8
Browser Script Considerations	14-9
Look for Alternatives to Scripting	14-10
Reasons to Avoid Siebel Scripting	14-11
Customization: Level of Effort (LOE)	14-12
Scripting Alternatives: Administrative Solutions	14-13
Scripting Alternatives: Declarative Configuration	14-14
Scripting Alternatives: User Properties	14-15

When You Need to Script 14-16
Lesson Highlights 14-17
Practice 14 Overview: Exploring Scripts 14-18

15 SmartScript Overview

Objectives 15-2
Business Challenges 15-3
Further Challenges 15-4
Administrative Challenges 15-5
Siebel Solution: SmartScript 15-6
SmartScript Advantages 15-7
Examples of SmartScript Uses 15-8
Siebel SmartScript Views 15-9
Employee Views 15-10
Customer Views 15-11
SmartScript Administration Views 15-12
Task UI versus SmartScripts 15-13
Lesson Highlights 15-14
Practice 15 Overview: Exploring a Siebel SmartScript 15-15

16 Creating a SmartScript

Objectives 16-2
Siebel SmartScript Elements 16-3
Steps to Create a SmartScript 16-4
1. Map out the Design 16-5
2. Create the Questions 16-6
Advanced Question Options 16-7
3. Create the Translations 16-8
4. Create Answers 16-9
5. Create Pages 16-10
6. Add Additional Questions to Pages 16-11
7. Create the Script 16-12
8. Add Pages to the Script 16-13
9. Test the SmartScript 16-14
10. Release the SmartScript 16-15
Importing and Exporting SmartScripts 16-16
Lesson Highlights 16-17
Practice 16 Overview: Creating a SmartScript 16-18

17 Advanced SmartScript Features

- Objectives 17-2
- Customizing the Look and Feel of Questions 17-3
- Further Customization 17-4
- Technical Challenge and Solution 17-5
- User Parameters 17-6
- Using User Parameters 17-7
- Example: Personalizing SmartScripts 17-8
- Technical Challenge and Solutions 17-9
- Active Business Components and Records 17-10
- Avoiding New Records 17-11
- Method 1: Using Search Specifications 17-12
- Example: Question 1 17-13
- Example: Question 2 17-14
- Method 2: Not Saving Parent Records 17-15
- Example: Question 1 17-16
- Example: Subsequent Questions 17-17
- Method 3: Use a Custom Button or Menu Item to Invoke the SmartScript from an Applet 17-18
- Method 4: Scripting 17-19
- Using Active Records 17-20
- User Parameters and Business Component Fields 17-21
- Adding Pick Applets 17-22
- Adding MVG Applets 17-23
- Scripting and SmartScripts 17-24
- Example: Save a User Parameter to an Active Business Component Field 17-25
- Lesson Highlights 17-26
- Practice 17 Overview: Creating Advanced SmartScripts 17-27

18 Siebel State Models

- Objectives 18-2
- Business Entities and Life Cycles 18-3
- Business Challenge 18-4
- Business Solution 18-5
- State Model 18-6
- State Model: Transitions 18-7
- Enabling Siebel State Model 18-8
- Creating a State Model 18-9
- 1. Design the Desired Life Cycle 18-10
- 2. Create a New State Model 18-11
- 3. Specify Allowed States 18-12

- 4. Specify Allowed Transitions and Conditions 18-13
- 5. Specify Authorized Positions 18-14
- 6. Test the State Model 18-15
- Lesson Highlights 18-16
- Practice 18 Overview: Creating a Siebel State Model 18-17

19 Introducing Siebel Assignment Manager

- Objectives 19-2
- Business Challenge 19-3
- Business Solution: Siebel Assignment Manager 19-4
- Assignment Rules 19-5
- Assignment Objects 19-6
- Assignment Object Definitions 19-7
- Assignment Candidates 19-8
- Static and Dynamic Assignment Candidates 19-9
- Assignment Criteria 19-10
- Administering Assignment Rules 19-11
- Examples of Assignment Rules 19-12
- Scenario 1: Assign Accounts by Sales Region 19-13
- Rule to Assign Accounts by Sales Region 19-14
- One Rule Per Sales Region 19-15
- Candidates for Rules 19-16
- Criteria for Rules 19-17
- Scenario 2: Assign Service Request to Skilled Agents 19-18
- Assign Service Request to Skilled Agents Rule 19-19
- Running Assignment Manager 19-20
- Lesson Highlights 19-21

20 Creating Assignment Rules

- Objectives 20-2
- Assignment Rules: Key Concepts 20-3
- Creating Assignment Rules 20-4
- Designing Efficient Assignment Rules 20-5
- Key Concepts for Creating Assignment Rules 20-6
- Person Candidate Source 20-7
- Comparison Method 20-8
- Scoring 20-9
- Assignee Filter 20-10
- Scenario 1: Assigning Accounts by Sales Region 20-11
- 1. Design the Assignment Rules 20-12
- 2. Create the Rule 20-13

- 3. Specify the Criteria 20-14
- 4. Specify the Candidates 20-15
- Scenario 2: Assigning Service Data to Employees 20-16
- 1. Design the Assignment Rule 20-17
- 2. Create the Rule 20-18
- 3. Specify the Criteria 20-19
- 4. Specify the Candidates 20-20
- 5. Associate Skills with Candidates 20-21
- 5. Associate Skills with Candidates: Scenario 20-22
- Testing Assignment Rules 20-23
- 1. Release Assignment Rules 20-24
- 2. Enable Detailed Logging 20-25
- 3. Run a Batch Assignment 20-26
- 4. Examine the Assigned Records 20-27
- 5. Inspect the Assignment Log Files 20-28
- Lesson Highlights 20-29
- Practice 20 Overview: Creating and Testing Assignment Rules 20-30

21 Understanding Assignment Methodology

- Objectives 21-2
- Assignment Methodology 21-3
- Determining Which Objects Have Candidates Assigned 21-4
- Overview of Assignment Methodology 21-5
- Assignment Methodology 21-6
- 1. Find Rules for the Object 21-7
- 1. Find Rules for the Object: Default Candidate 21-8
- 2. Evaluate Criteria for the Object 21-9
- 2. Evaluate Criteria for the Object: Rule Sequencing 21-10
- 2. Evaluate Criteria for the Object: Criteria Inclusion Method 21-11
- 2. Evaluate Criteria for the Object: Required Criteria 21-12
- 3. Compile a List of Candidates from Each Qualified Rule 21-13
- 4. Evaluate Each Candidate Against the Rule Criteria 21-14
- 5. Score Each Qualified Candidate for Each Rule 21-15
- 5. Score Each Qualified Candidate for Each Rule: Entering Scoring Data 21-16
- 5. Score Each Qualified Candidate for Each Rule: Workload Distribution 21-17
- 5. Score Each Qualified Candidate for Each Rule: Creating Workload Distribution Rules 21-18
- 5. Score Each Qualified Candidate for Each Rule: Adding Scoring for Workload Distribution 21-19
- 5. Score Each Qualified Candidate for Each Rule: End Result 21-20
- 6. Apply the Assignee Filter to the Scored Candidates 21-21

- 7. Choose the Primary Assignment Rule 21-22
- 7. Choose the Primary Assignment Rule: Exclusive Rules 21-23
- 8. Determine the Primary Assignee 21-24
- 9. Apply the Assignment Mode 21-25
- 10. Generate the Assignments 21-26
- Review: How to Use Assignment Rule Features 21-27
- Lesson Highlights 21-28
- Practice 21 Overview: Exploring Assignment Methodology 21-29

22 Configuring Assignment Manager

- Objectives 22-2
- Assignment Manager Configuration 22-3
- Assignment Objects 22-4
- Assignment Object Properties 22-5
- Modifying Assignment Object Properties 22-6
- Default Assignees 22-7
- Keep Manual Primaries 22-8
- Keep Creator 22-9
- Assignment Mode 22-10
- Assignment Mode: Independent 22-11
- Assignment Mode: Person-Oriented 22-12
- Assignment Mode: Organization-Oriented 22-13
- Assignment Mode: Org & Person-Oriented 22-14
- Lock Assignment Flag 22-15
- Disabling or Enabling Assignment with Lock Assignment Default Values 22-16
- Lesson Highlights 22-17
- Practice 22 Overview: Modifying Assignment Object Properties 22-18

23 Invoking Assignment Manager

- Objectives 23-2
- Running Assignment Manager 23-3
- Assignment Manager Server Components 23-4
- Batch Assignment 23-5
- Running a Batch Assignment Job 23-6
- Dynamic Assignment 23-7
- Implementing Dynamic Assignment 23-8
- Assignment Policies 23-9
- Generate Triggers 23-10
- Workflow Monitor Agent 23-11
- Assignment Manager Component (AsgnSrvr) 23-12
- Dynamic Assignment Process Flow 23-13

Running AsgnSrvr as a Business Service	23-14
Interactive Assignment	23-15
Using Interactive Assignment	23-16
Requirements for Interactive Assignment	23-17
Improving Assignment Manager Performance with Server Key Maps	23-18
Creating Server Key Maps	23-19
Lesson Highlights	23-20
Practice 23 Overview: Running Assignment Manager	23-21

Siebel 8.1.x Business Automation: Course Introduction

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Lesson Agenda

- This Lesson provides an introduction to the:
 - Instructor and class participants
 - Training site information
 - Course:
 - Audience
 - Prerequisites
 - Goal
 - Objectives
 - Methodology
 - Materials
 - Agenda

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Instructor and Class Participants

- Who are you?
 - Name
 - Company
 - Role
- What is your prior experience?
 - Siebel applications
 - Siebel Tools and configuration
 - Relational database
- How do you expect to benefit from this course?

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Training Site Information

Rest rooms

Class duration and breaks

Telephones

Meals and refreshments

Fire Exits

Questions?

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Course Audience

- This course is designed for implementation team members who need to automate business processes in Siebel applications
 - Developers
 - Configurators
 - Other implementation team personnel

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Course Prerequisites

- Siebel 8.0 Technical Foundations (required)
- Siebel 8.0 Fundamentals (recommended)
- Siebel 8.1.x Tools (recommended)

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Course Goal

- To enable participants to use the Siebel client and Siebel Tools to automate business processes in the Siebel application to meet common business requirements

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Course Objectives

- Create, test, and deploy Siebel workflow processes
- Enable Siebel Inbox access for existing data types
- Build validation rule sets for Siebel Data Validation Manager
- Create, test, and deploy user-interactive automation using Siebel Task UI
- Describe the role of scripting in Siebel business automation
- Use Siebel SmartScript to script employee interactions with customers
- Use Siebel State Model to enforce business requirements
- Assign business data efficiently using Siebel Assignment Manager

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Course Methodology

- Subject matter is delivered through:
 - Lecture and slide presentations
 - Software demonstrations
 - Class discussions
 - Hands-on practices

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Course Materials

- Course content is delivered over five days
- Student Guide
 - All slides presented during lecture
 - Student notes with references to the Siebel Bookshelf documentation library
- Activity Guide
 - Hands-on exercises and solutions

ORACLE

Siebel Documentation

- Siebel applications are documented in Siebel Bookshelf, a searchable collection of guidebooks
 - Bookshelf is also called Siebel Business Applications Documentation Library
 - Updated regularly
- In the classroom, Siebel Bookshelf is available on Oracle Technology Network
 - www.oracle.com/technology/documentation/siebel.html
 - Make sure you are using the appropriate version of Bookshelf
 - Example: Siebel 8.1

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Siebel Documentation

References in the lessons to Siebel Bookshelf use the convention *Bookshelf Title*, “Chapter Name”.

Feedback

- If you have feedback on this or other Siebel courseware, please email SIEBEL_CRM_CURRICULUM_WW@oracle.com

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Course Agenda

Business Services and Workflow

- Lesson 1: Siebel Business Services
- Lesson 2: Building Siebel Workflow Processes
- Lesson 2a: Siebel Workflow Practices
- Lesson 3: Testing and Deploying Workflow Processes
- Lesson 4: Siebel Workflow Architecture
- Lesson 5: Building Robust Workflows
- Lesson 6: Invoking Workflow Processes:
Runtime Events and Custom Controls
- Lesson 7: Using Workflow Policies

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Course Agenda

Other Automation Infrastructure

- Lesson 8: Configuring the Universal Inbox
- Lesson 9: Using Siebel Data Validation Manager

Task UI

- Lesson 10: Siebel Task UI
- Lesson 11: Creating a Task
- Lesson 12: Transient Business Components
- Lesson 13: Additional Task UI Configuration

Scripting

- Lesson 14: Introducing Scripting

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Course Agenda

Client Automation

- Lesson 15: SmartScript Overview
- Lesson 16: Creating a SmartScript
- Lesson 17: Advanced SmartScript Features
- Lesson 18: Siebel State Models

Assignment Manager

- Lesson 19: Introducing Siebel Assignment Manager
- Lesson 20: Creating Assignment Rules
- Lesson 21: Understanding Assignment Methodology
- Lesson 22: Configuring Assignment Manager
- Lesson 23: Invoking Assignment Manager

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Summary

- This lesson provided an introduction to the:
 - Instructor and class participants
 - Training site information
 - Course:
 - Audience
 - Prerequisites
 - Goal
 - Objectives
 - Methodology
 - Materials
 - Agenda

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 0 Overview: Preparing the Classroom Environment

This practice covers the following topics:

- Exiting any existing Siebel applications
- Running the classroom refresh utility to prepare the classroom for this course

Note: Successfully completing this practice is critical to ensure subsequent practices behave as expected.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Preparing the Classroom Environment

Practices for this and all other lessons are found in the course's Activity Guide.

1

Siebel Business Services

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Describe a business service
- Describe the structure and role of property sets
- Use the business service simulator to test a business service

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Automating Business Processes

- A business process is a series of activities executed to achieve a specific business objective
 - Example: the Quote to Cash business process (how an enterprise creates a quote and converts it to an order for submission)
- Automation options within the Siebel application can address such challenges as:
 - Maintaining and standardizing consistent business processes across all business units
 - Routing and assigning tasks accurately and efficiently
 - Responding in a timely, effective manner to customer inquiries and service requests
 - Assisting users with the implementation of best practices
 - Offering consistent and personalized service to customers

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Siebel Automation Facilities

- Siebel applications include functionality to automate business processes:
 - Workflow Processes
 - Automate steps in a business process
 - Tasks
 - Guide users through a series of views to complete a step in a business process
 - Assignment Manager
 - Automates assignment of data (such as opportunities and service requests) to the desired people
 - State Model
 - Enforces a limited life cycle for select business entities
 - SmartScript
 - Guides an employee through complex customer interactions

ORACLE

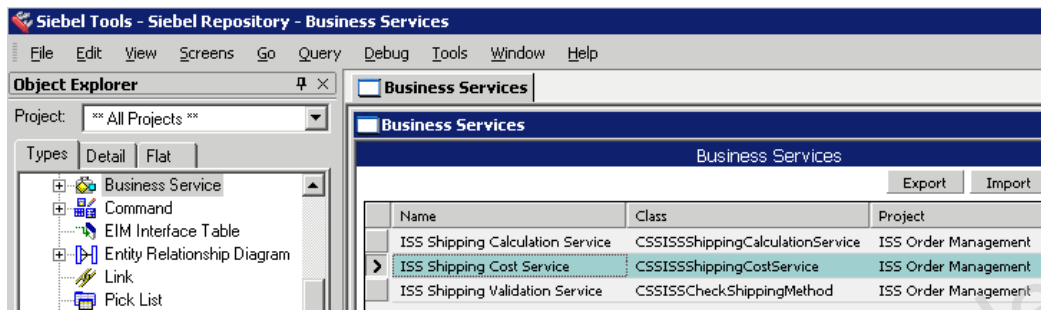

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Siebel Automation Facilities

The facilities listed in this slide are all topics in this course. Several other automation-related facilities, such as Siebel Inbox and Data Validation Manager, are also covered in this course.

Business Service

- Is a unit of functionality that is reusable and globally accessible
 - Example: The ISS Shipping Cost Service computes shipping charges corresponding to a company's shipping policies
- Enables business logic to be executed repeatedly in multiple different contexts
 - Business logic is not restricted to a specific object (business component, applet, and so forth)

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Business Service

There is no single Bookshelf reference for business services, but instead they are documented in the reference that is related to the business service functionality. For example, business services for sending emails or other communications are referenced in the *Siebel Communications Server Administration Guide*, and business services related to sales order processing are described in the *Siebel Order Management Infrastructure Guide*.

Prebuilt Business Services

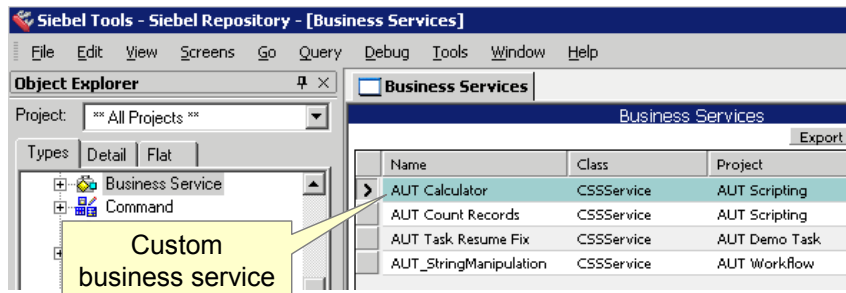

- Siebel repository contains many prebuilt business services to support processing in areas such as:
 - Customer order management
 - ISS Credit Check Service
 - ISS Shipping Cost Service
 - Enterprise application integration (EAI)
 - EAI Siebel Adapter
 - EAI HTTP Transport
 - XML document processing
 - XML Hierarchy Converter
 - XML Converter
 - Communications
 - Outbound Communications Manager
 - Inbound E-mail Manager

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Repository-Stored Business Services

- Some business services are stored in the Siebel repository
 - Siebel-developed business services
 - Are written in C++
 - Cannot be modified by customers
 - Custom business services developed by users
 - Are written in Siebel Visual Basic or eScript
 - Are created and modified by customers using Siebel Tools

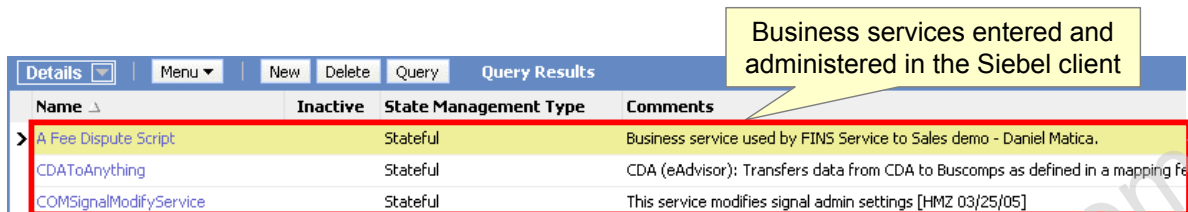

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Client-Stored Business Services

- Some business services are stored in the client database
 - Siebel-developed business services
 - Custom business services developed by users
- Client-stored business services
 - Are written in Siebel Visual Basic or eScript
 - Are created and modified by customers using the Administration - Business Services screen
 - Are never executed if there is a repository-stored business service of the same name

Name	Inactive	State Management Type	Comments
> A Fee Dispute Script		Stateful	Business service used by FINS Service to Sales demo - Daniel Matica.
CDAToAnything		Stateful	CDA (eAdvisor): Transfers data from CDA to Buscomps as defined in a mapping fe
COMSignalModifyService		Stateful	This service modifies signal admin settings [HMZ 03/25/05]

ORACLE

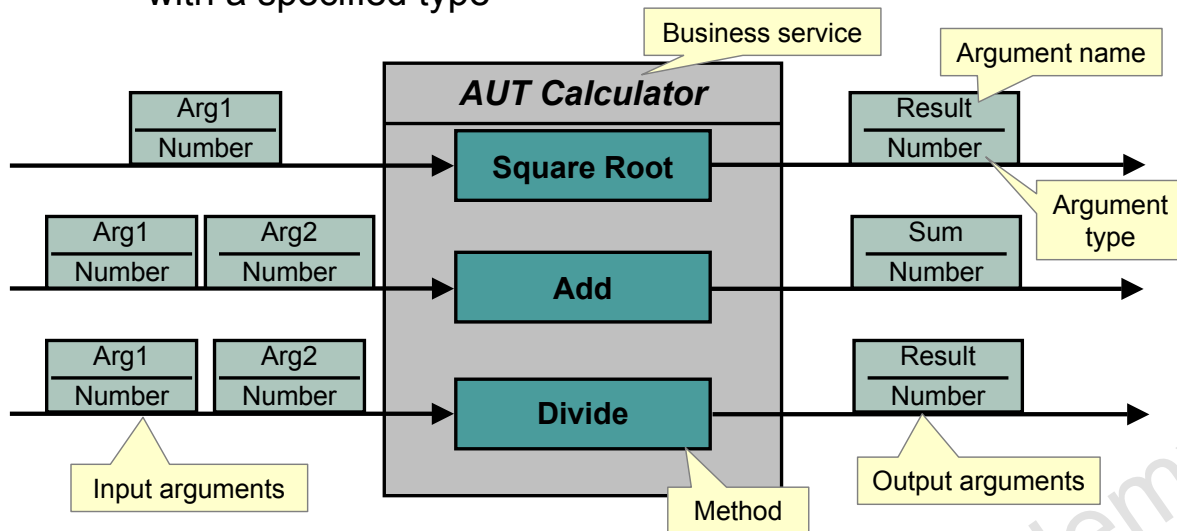

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Client-Stored Business Services

The term “client database” refers to tables in the Siebel database that store user data.

Methods

- A business service consists of one or more operations called methods
 - Each method has a set of input and output arguments, each with a specified type

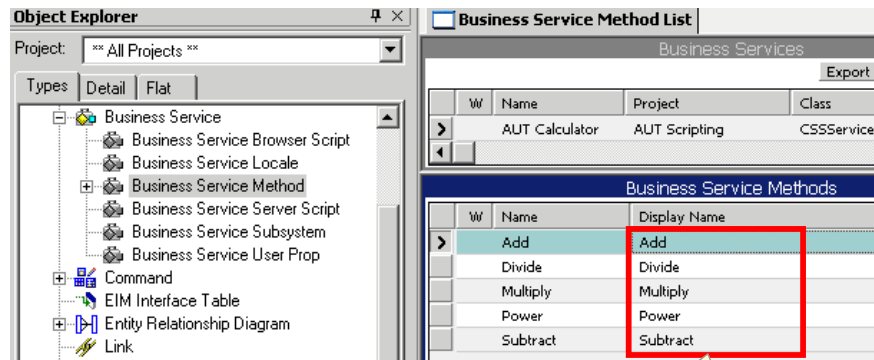

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Identifying Methods for a Business Service

- In Siebel Tools, navigate to Business Service | Business Service Method

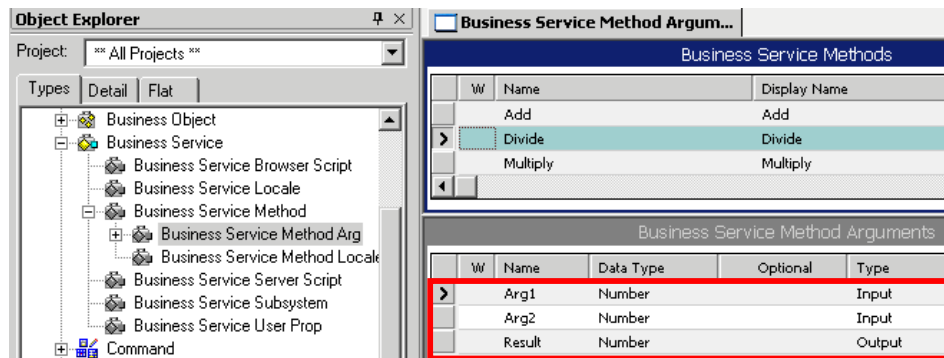

Name that appears in the client when selecting a business service method

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Identifying Arguments and Types for a Method

- In Siebel Tools, navigate to Business Service | Business Service Method | Business Service Method Arg

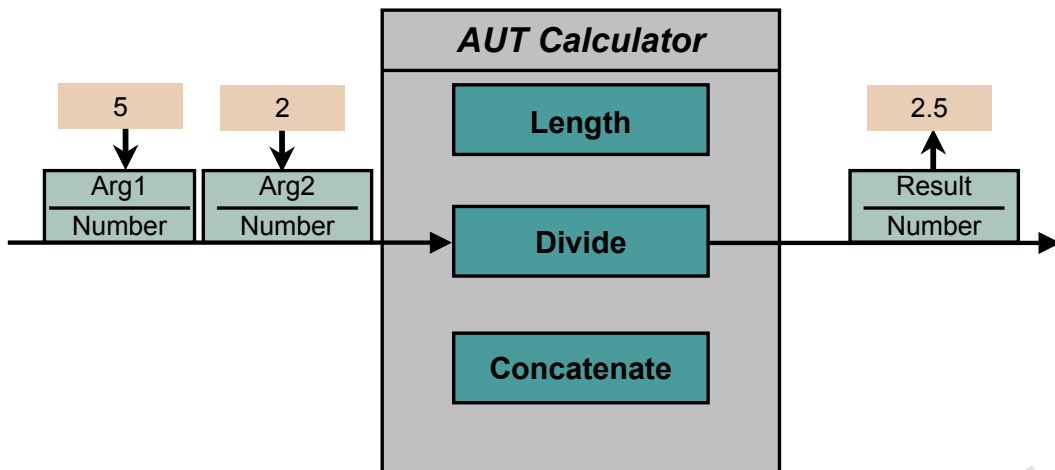

Arguments for
Divide method

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking a Method

- Involves:
 - Assigning values to the input parameters
 - Not all input parameters are required to have values
 - Retrieving the values assigned to the output parameters

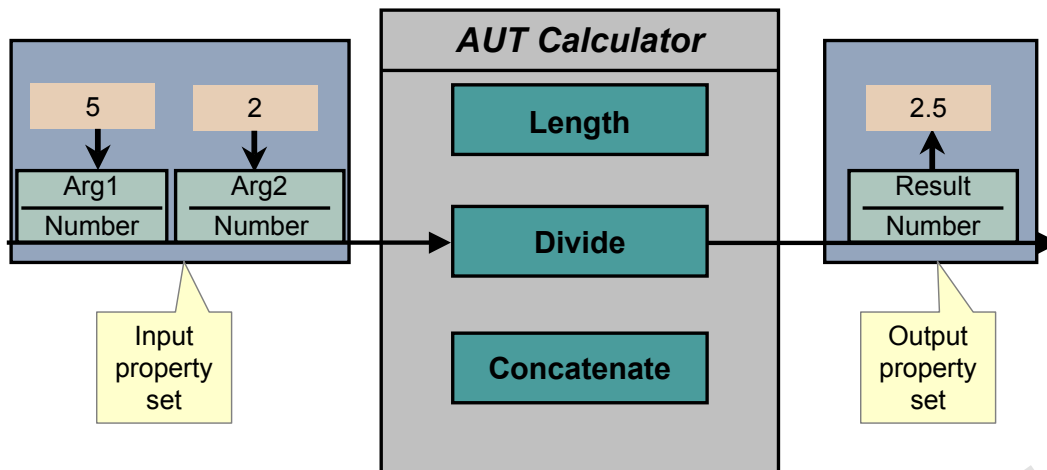

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Property Set

- Is the in-memory data structure used to:
 - Pass a set of input arguments into a method
 - Receive a set of output arguments from a method

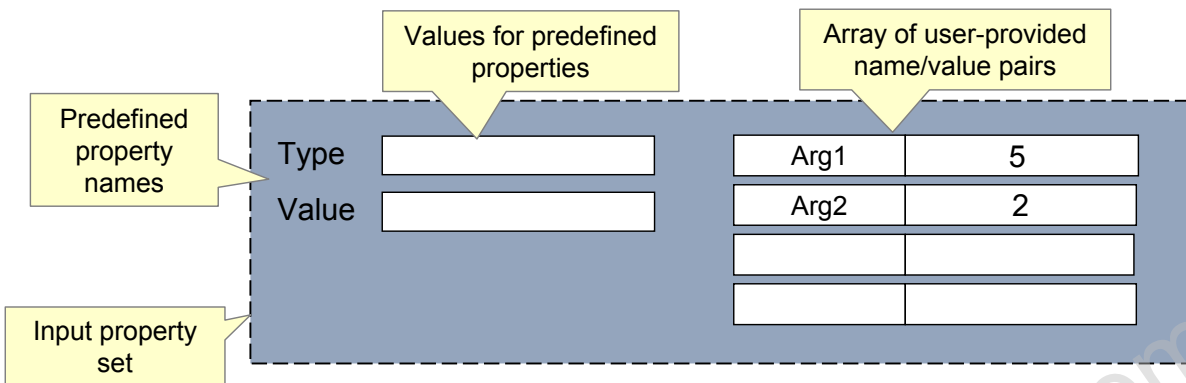

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Property Set

- Represents data using name/value pairs
- Has two predefined properties: Type and Value
- Has an array for storing user-provided name/value pairs
- Is automatically created and populated when invoking most business services from a Siebel workflow or task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Testing a Business Service

- Use the business service simulator in the Siebel Client
 - Navigate to Administration - Business Service > Simulator
 - Select the business service and method
 - Create the property set name/value pairs
 - Optionally load data from an input file

The screenshot displays the Siebel Client Simulator interface. The top section, titled 'Simulator', contains a table with columns 'Service Name', 'Method Name', and 'Iterations'. A row is highlighted with 'AUT Calculator' as the Service Name, 'Divide' as the Method Name, and '1' as the Iterations. A yellow callout box labeled 'Business service and method' points to this row. Below this is the 'Input Arguments' section, which includes a table with columns 'Test Case #', 'Type', 'Value', 'Child Type', 'Child Value', 'Property Name', and 'Property Value'. A row is highlighted with '1' as the Test Case #, 'Arg1' as the Property Name, and '5' as the Property Value. To the right, a 'Property Set Properties - Microsoft ...' dialog box is open, showing a table with columns 'Property Name' and 'Value'. A row is highlighted with 'Arg1' as the Property Name and '5' as the Value. A yellow callout box labeled 'Input property set' points to this row. The Oracle logo is visible in the bottom right corner of the interface.

Service Name	Method Name	Iterations
AUT Calculator	Divide	1

Business service and method

Test Case #	Type	Value	Child Type	Child Value	Property Name	Property Value
1					Arg1	5

Property Name	Value
Arg2	2
Arg1	5

Input property set

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Testing a Business Service

- Use the business service simulator in the Siebel client
 - Click Run on One Input
 - Examine the output property set name/value pairs
 - Optionally save the output to a file

The screenshot displays the Siebel Business Service Simulator interface. At the top, there is a menu bar with options: Simulator, Menu, New, Delete, Query, Run, Load From File..., Save To File..., and Run on One Input (highlighted with a red box). Below the menu bar is a table with columns: Service Name, Method Name, and Iterations. The table contains one row: > AUT Calculator, Divide, 1. Below this table is another menu bar with options: Input Arguments, Menu, New, Delete, Query, Load From File..., and Save To File.... Below this menu bar is a table with columns: Test Case #, Type, Value, Child Type, Child Value, Property Name, and Property Value. The table contains one row: > 1, , , , , Arg1, 5. Below this table is a third menu bar with options: Output Arguments, Menu, Query, Move To Input, and Save To File.... Below this menu bar is a table with columns: Test Case, Iteration, Type, Value, Property Name, and Property Value. The table contains one row: > 1, 1, , , Result, 2.5. The 'Result' and '2.5' cells are highlighted with a red box.

Service Name	Method Name	Iterations
> AUT Calculator	Divide	1

Test Case #	Type	Value	Child Type	Child Value	Property Name	Property Value
> 1					Arg1	5

Test Case	Iteration	Type	Value	Property Name	Property Value
> 1	1			Result	2.5

Output property set

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Lesson Highlights

- A business service is a unit of functionality that is reusable and globally accessible
 - Can be stored in the repository or in user database tables
 - Consists of one or more methods
 - Each method is specified by a set of input and output arguments
- A property set is an in-memory data structure consisting of name value pairs
- A business service
 - Is invoked by passing in the input arguments in a property set
 - Returns the output arguments in a property set
- Use the business service simulator to test a business service

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 1 Overview: Simulating a Business Service

This practice covers the following topics:

- Importing a custom business service into the repository
- Examining the methods and arguments for a business service
- Using the business service simulator to test a business service

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2

Building Siebel Workflow Processes

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

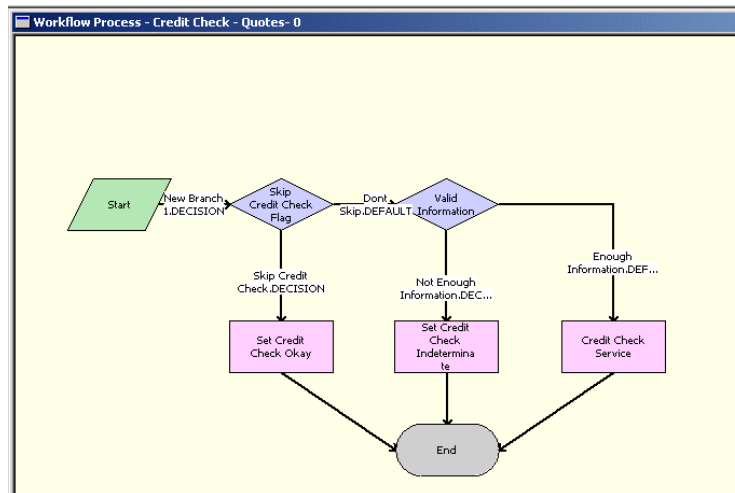

- List the types of workflow processes and workflow steps
- Create a new workflow process and configure business service, Siebel operation, and decision steps

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Process

- Is an ordered set of steps executed in response to a defined set of conditions
- Is used to automate parts of a business process in a Siebel application

ORACLE

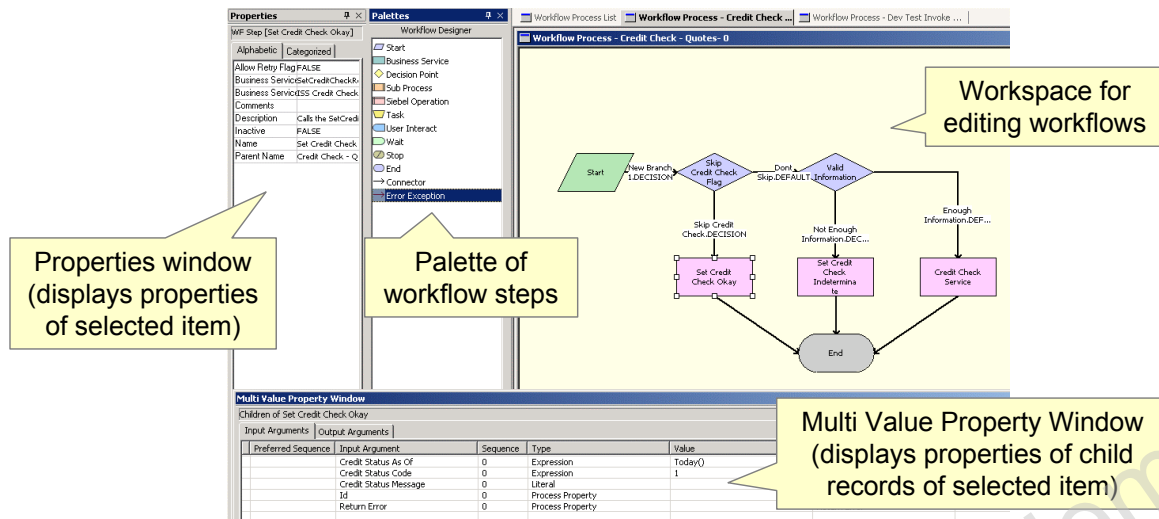

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Process

Bookshelf documents workflow processes in the *Siebel Business Process Framework: Workflow Guide*.

Workflow Designer

- Siebel Tools includes a Workflow Designer used to create, examine, and modify Siebel workflow processes
 - Contains a palette, workspace, and associated property windows

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

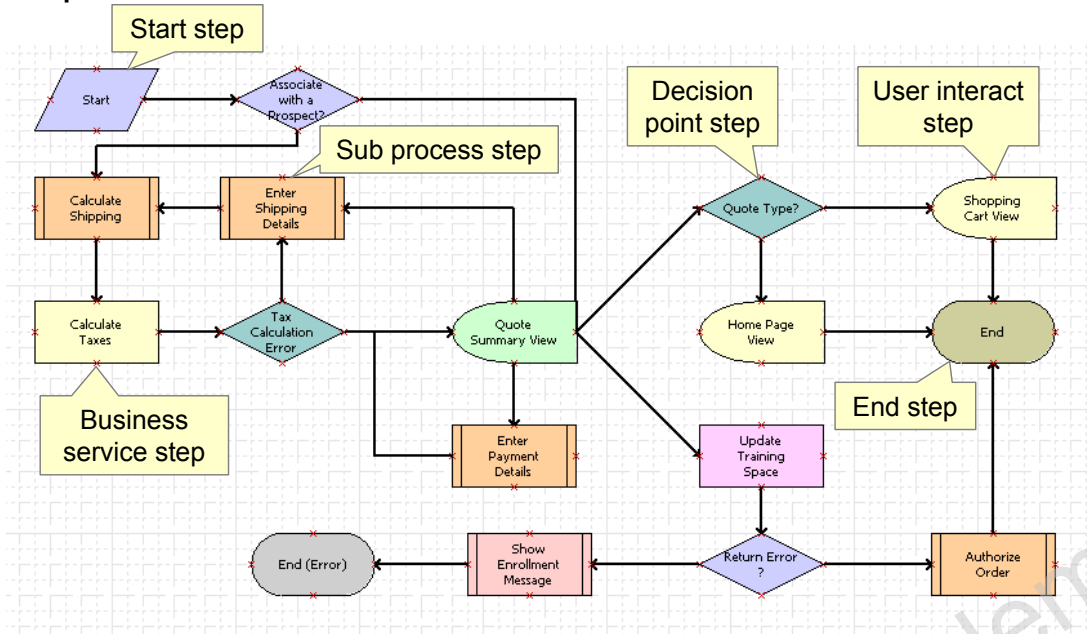

Workflow Designer

The Workflow Designer is discussed in Bookshelf's *Siebel Business Process Framework: Workflow Guide*, "For Developers: Basics of Building Workflow Processes".

Workflow Process Steps

- Siebel workflow processes consist of different types of steps

eSales - Complete Checkout Process

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Common Workflow Process Steps

- All workflow processes have a:
 - Start step
 - End step
- Workflow processes often include the following common steps:
 - Siebel operation step
 - Business service step
 - Decision point step

More

ORACLE

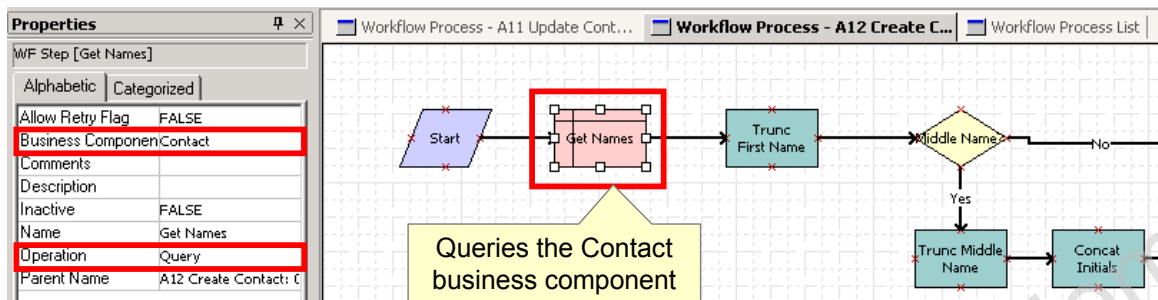

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Common Workflow Process Steps

Other step types and connectors, such as Sub-process, Stop and Error Exception are covered in a later lesson. Task steps are used to embed Siebel Tasks in workflow processes. Tasks are covered later in this course.

Siebel Operation Step

- Performs the following operations on a business component:
 - Insert
 - Update
 - Delete
 - Query
 - NextRecord and PreviousRecord operations supported for iteration over multiple records returned by a query

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

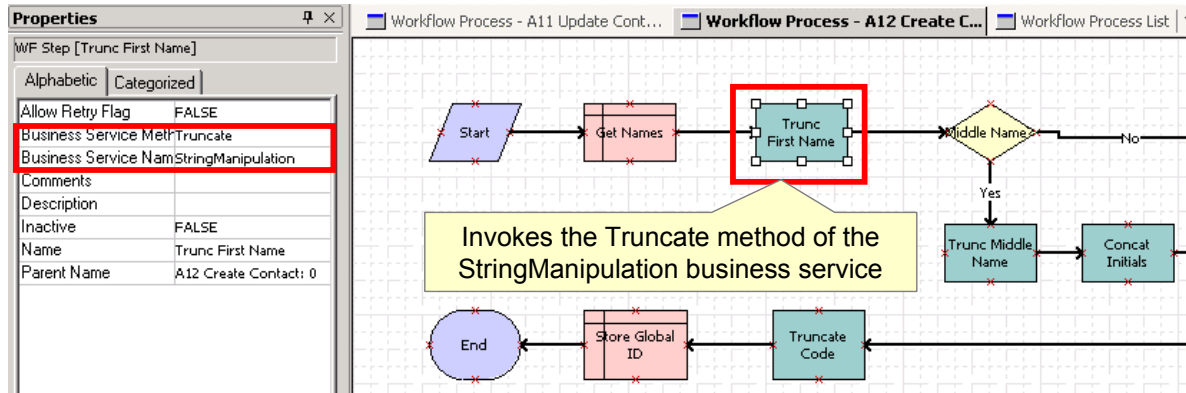

Siebel Operation Step

QueryBiDirectional and Upsert operations are also supported.

Performing queries in workflows is covered in depth in a later lesson.

Business Service Step

- Invokes a method of a business service

ORACLE

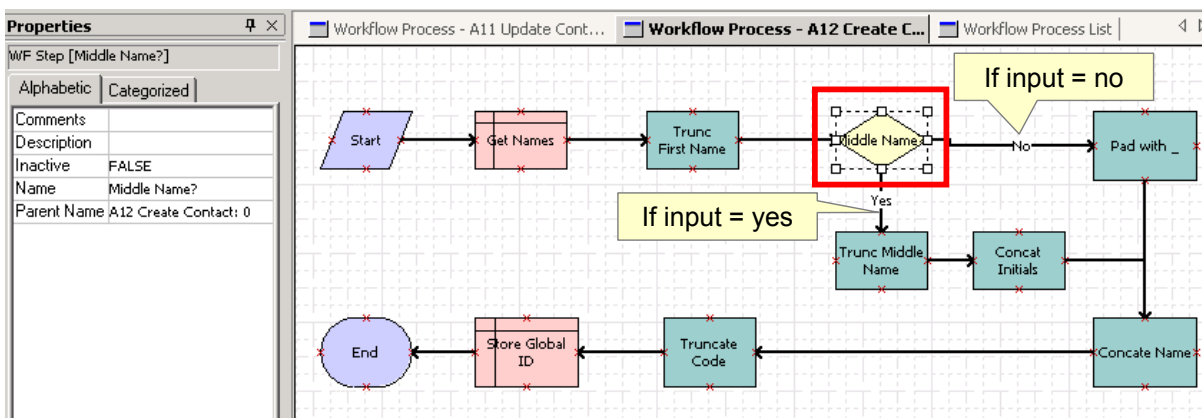

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Business Service Step

StringManipulation is a user-provided business service that performs simple operations on string inputs, such as truncate, concatenate, or length. You will use this business service in one of this lesson's practices.

Decision Point Step

- Allows a workflow to branch to one of multiple steps based on the value of inputs

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Decision Point Step

Notice that the Properties window does not reveal the decision logic. The branching logic associated with a Decision Point step is part of the connectors attached to the step, and will be discussed later in this lesson.

Process Properties

- Process properties are variables that store inputs used by and outputs produced by workflow steps
- Each workflow process has a set of process properties that persist while the workflow process is executing
 - Some are populated when the workflow process is invoked
 - Some return data to the invoking workflow process or business service upon completion

Name	Display Name	In/Out	Business Object	Data Type
FirstName		In/Out	Contact	String
LastName		In/Out	Contact	String
MiddleInit		In/Out	Contact	String
MiddleName		In/Out	Contact	String
Object Id		In/Out	Contact	String
Process Instance Id		In/Out	Contact	String
Siebel Operation Object Id		In/Out	Contact	String

Properties specific to this workflow

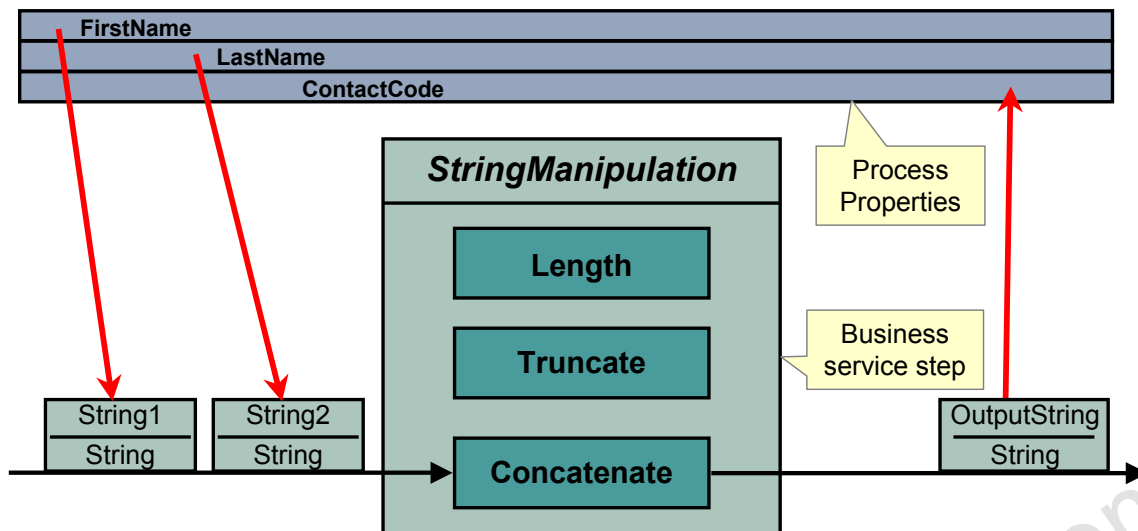

Default properties for all workflows

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Process Properties

- Provide inputs to workflow steps
- Receive outputs from workflow steps
 - Can be used as inputs for subsequent steps

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Configuring a Siebel Workflow

To configure a new workflow process in the Siebel Tools Workflow Designer:

1. Create a New Workflow Process
2. Specify Process Properties
3. Add Workflow Steps
4. Configure Workflow Steps
5. Validate the Workflow Process

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Create a New Workflow Process

- In Siebel Tools, select the Workflow Process object type
- Create a new workflow process definition
 - Enter the process name
 - Assign the process to a locked project
 - Assign a business object
 - Provides context for references to business components and fields
- Right-click and select Edit Workflow Process to invoke the Workflow Designer

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Create a New Workflow Process

A business object must be specified whenever you use a workflow step (such as a Siebel Operation step) that references a business component. In addition if a workflow references a business object, then the workflow must be executed in the context of that business object.

2. Specify Process Properties

- Select the Process Properties tab in the Multi Value Property Window (MVPW) to display the default process properties
- Edit the default set of process properties
 - Add new process properties to store additional values created and used by the workflow steps
 - Leave the default process properties unchanged

Process Properties		Process Metrics				
Name	Display Name	In/Out	Changed	Business Object	Data Type	
FirstName		In/Out	TRUE	Contact	String	
ContactCode		In/Out	TRUE	Contact	String	
Error Code		In/Out	TRUE	Contact	String	
Error Message		In/Out	TRUE	Contact	String	
Object Id		In/Out	TRUE	Contact	String	
Process Instance Id		In/Out	TRUE	Contact	String	
Siebel Operation Object Id		In/Out	TRUE	Contact	String	

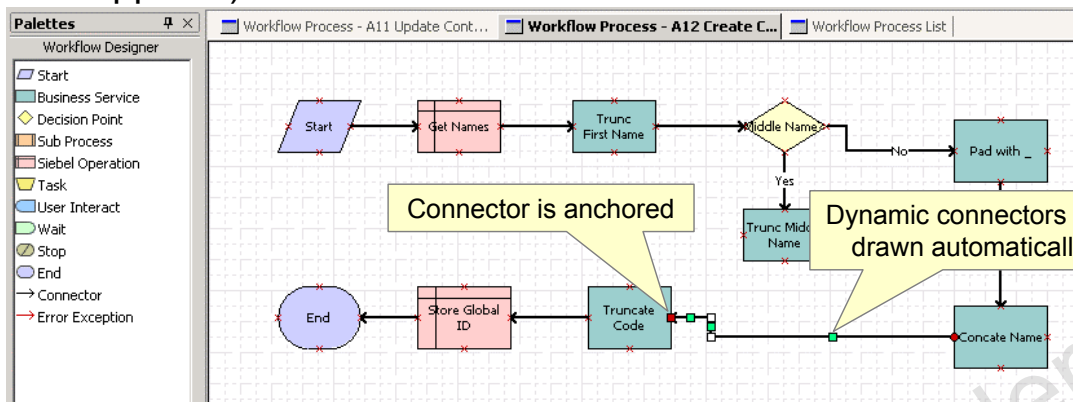

Default process properties
for all workflows

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Add Workflow Steps

- Add a start and end step to the designer
 - Drag steps from the palette to the workspace
- Add other steps as required
- Add connectors to sequence the steps
 - Make sure that connector ends are anchored (red box appears)

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Configure Workflow Steps: Siebel Operation

- Specify the business component and operation
 - Use the properties window
- Specify additional child arguments as required in the MVPW
 - Examples: Field names, search spec input arguments, output arguments

Properties

WF Step [Get Names]

Alphabetic | Categorized

Allow Retry Flag FALSE

Business Component Contact

FirstName	1	Business Component
LastName	2	Business Component
MiddleName	3	Business Component

Fields retrieved

Business Component Name	Business Component Field
Contact	First Name
Contact	Last Name
Contact	Middle Name

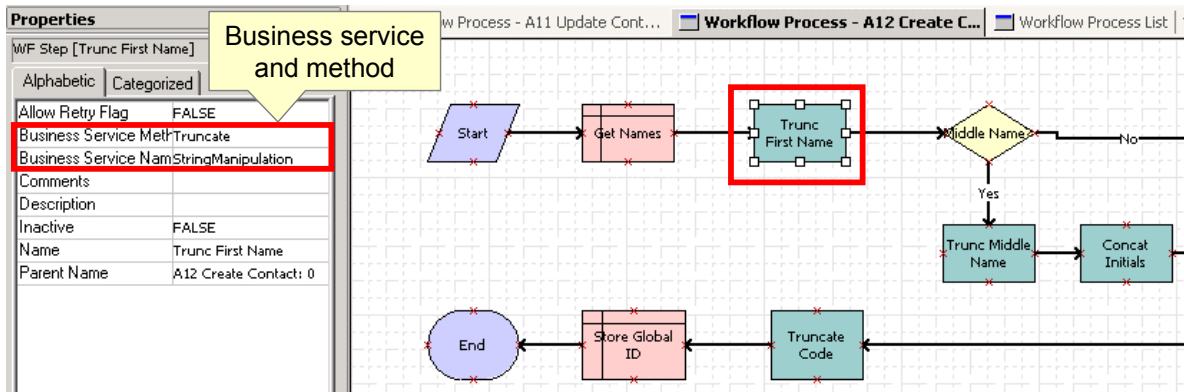

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Configure Workflow Steps: Siebel Operation

In the screenshot shown, the Search Spec Input Arguments tab is used to specify the search specification for a query operation. This topic will be covered in a later lesson.

4. Configure Workflow Steps: Business Service

- Specify the business service name and business service method
 - Use the Properties window

More

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Configure Workflow Steps: Business Service Specify Input and Outputs

- Specify inputs to use in the workflow
 - Select the Input Arguments tab in the MVPW
 - Define each input
- Specify outputs of the business service step
 - Select the Output arguments tab in the MVPW
 - Assign each output to a process property

Multi Value Property Window

Children of Trunc First Name

Input Arguments Output Arguments

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Configure the Steps: Decision Point Step

- Set conditions on each branch (connector) originating at the step:
 - Select the connector
 - Right-click and select Edit Conditions

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Configure the Steps: Decision Point Step Set Condition

- Enter the condition criteria for each branch in the Compose Condition Criteria dialog box
- Do not create a condition criteria for the default branch
 - Execution path taken if no other branches are satisfied

Compose Condition Criteria

Conditions

Compare To	Operation	Object	Field	Value
Process Property	Is Not Null	MiddleName		<input checked="" type="checkbox"/>

Does contact have a middle name

Compose a Condition

Compare To: Process Property

Operation: Is Not Null

Object: MiddleName

Field:

Values:

New Add Update Delete

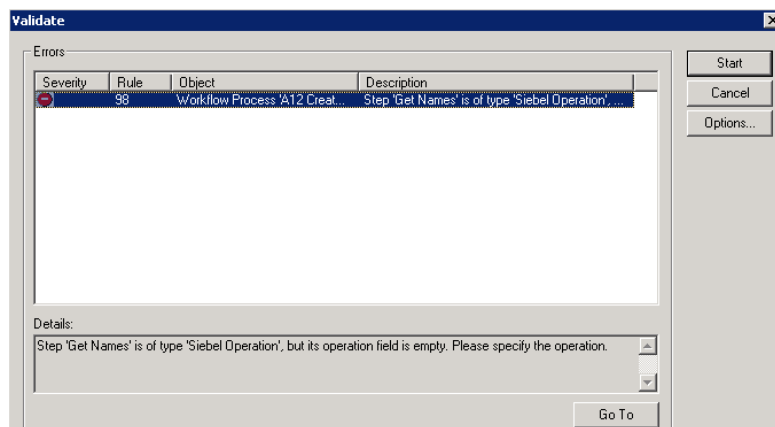

OK Cancel

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

5. Validate the Workflow Process

- Save configuration performed in the Workflow Designer
- Return to the Workflow Process List
- Right-click the workflow and select Validate
- Click Start to perform the validation checks
 - Syntactic errors are displayed in the Errors window

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Additional Workflow Steps

- Siebel workflows may contain additional types of steps:
 - Sub process
 - Invokes another workflow process as a sub process
 - User interact
 - Navigates the user to a view and waits for user activity
 - Wait
 - Pauses the workflow for a specified period before proceeding
 - Stop
 - Stops the workflow process instance if a predefined exception occurs
 - Task
 - Invokes a Siebel task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Additional Workflow Steps

Other Step Types

Sub process and stop steps are covered in a later workflow lesson, and Siebel tasks are covered later in the course.

User Interact Steps

User interact steps are used in Interactive Flow workflows (discussed in a later lesson). In most circumstances, Siebel Task UI should be used instead of Interactive Flow workflows. Task UI will be discussed in a later lesson.

Workflow Modes

- Workflows have a mode property that describes their runtime behavior:
 - Service Flow
 - Executes a discrete set of steps and completes
 - Is the default mode for a new workflow
 - Cannot include wait or user interact steps
 - Interactive flow
 - Designed to navigate users through a set of views
 - Is being replaced by Siebel tasks
 - Long running flow
 - Is a workflow that persists for some indeterminate period of time
 - Can be paused and resumed as an inbox item
 - Cannot include a wait step
 - 7.0 flows
 - For backward compatibility: do not use for new workflows

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Lesson Highlights

- A workflow process is an ordered set of steps executed in response to a defined set of conditions
 - Automates parts of a business process
- Siebel workflow processes consist of different step types
- Process properties are variables that store inputs used by and outputs produced by workflow steps
- Build a workflow process by:
 - Creating a new workflow process
 - Specifying the process properties
 - Adding workflow steps
 - Configuring each step
 - Validating the workflow process

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 2 Overview: Building Workflow Processes

This practice covers the following topics:

- Configuring a workflow process that includes business service steps
- Configuring a workflow process that includes a decision point step

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2a

Siebel Workflow Practices

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Two Workflow Processes

- In the Siebel Workflow practices, create and modify two workflow processes:
 - AUT Create Contact Identifier
 - AUT Big Opportunity

More

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

AUT Create Contact Identifier: Functional Requirement

- For a Contact record:
 - Construct an identifier for the contact using the first letter of the first name plus the last name
 - Example: Mary Smith has identifier MSmith
 - Put the result in an unused field that is displayed for the Contact
 - Use the Contact business component field Mail Stop, which is visible in the Contact Form Applet - Child

The diagram illustrates the functional requirement for creating a contact identifier. It shows a form titled "Mary Smith" with fields for "Last Name" (Smith) and "First Name" (Mary). A red box highlights these two fields, and a red arrow points from this box to another red box containing the "Mail Stop" field, which displays "MSmith". A yellow callout box points to the "Mail Stop" field with the text: "Contact Identifier constructed from First and Last Name".

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

AUT Create Contact Identifier: Implementation

- Implement this workflow using a custom business service, AUT_StringManipulation
 - Has three methods for strings:
 - Concatenate: combines two strings
 - Length: returns the length of a string
 - Truncate: returns a substring of a specified length
 - Characters can be removed from the right or left end of an input string

Business Services				
W	Name	Changed	Project	Cache
	AUT_StringManipulation	✓	AUT Workflow	CSSService
Business Service Methods				
W	Name	Changed	Display Name	Display Name - String Refer
	Concatenate	✓	Concatenate	
	Length	✓	Length	
	Truncate	✓	Truncate	

- Use a Siebel Operation step to update the Mail Stop field

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

AUT Create Contact Identifier: Implementation

Truncate Method

Truncate takes the following input arguments:

- Input String: the string to be truncated
- Length: the length of the substring returned
- Direction: indicates which end of the string the returned substring is taken from; takes values Left (the default) and Right.

Workflow vs. Calculated Field

This workflow's specific requirement could be implemented using a calculated business component (BC) field. Such a field is calculated at runtime using an expression that uses other BC field values or system values, such as the current time. To meet the requirement using a calculated field set the Calculated Value property for a new BC field to `Left([FirstName],1)+[Last Name]`. `Left()`, a built-in function, is similar to `AUT_StringManipulation`'s Truncate method.

If you wanted to store the identifier without run-time calculation, then you could create a field with pre-default value equal to the expression above.

Using a workflow rather than a calculated field would be appropriate if:

- You use a more complex algorithm to construct the identifier
- You need to create a unique contact identifier. A workflow could query for a matching identifier, and if found, could use an alternate algorithm for constructing a unique identifier.

AUT Big Opportunity: Functional Requirement

- For an Opportunity record:
 - If Revenue is \$1,000,000 or more, and Sales Stage is Submitted, Approved, or Rejected
 - Then send an email notification to all members of the Opportunity's sales team
- Email notification should include information on the Opportunity, such as name, revenue, primary on the sales team, and sales stage

From: siebel_workflow@localhost.com **To:** siebel_user@localhost.com
Subject: Big Opportunity

New Opportunity > \$1,000,000 in Submitted or later stage:

Name: Test Opportunity
Account: Acme Company
Revenue: \$1,500,000.00
Primary on Sales Team: SADMIN
Sales Stage: Submitted

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

AUT Big Opportunity: Implementation

- You will implement this workflow in stages:
 - First version will test email capability
 - Final version will add opportunity information to the email notification
- You will use the Siebel Communications Server to send email
 - Enable the Communications Management component group
- The Communications Outbound Manager server component:
 - Provides a business service interface
 - Is used for outbound email, phone, fax, and other message types

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Outbound Communications Manager Business Service

- Uses the server component of the same name
- Has two methods that you will use to send Email:
 - **SendMessage**
 - Sends a test message with no substitutions
 - You provide input arguments, including:
 - List of recipient addresses
 - Message
 - Communications Profile name (discussed later)
 - **CreateRequest**
 - Creates a message that can include substitutions from the current object (Opportunity)
 - You provide input arguments, including:
 - Communications Profile name
 - A communications Template name (discussed later)
 - Recipient Group

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Outbound Communications Manager Business Service

The Siebel Communications Server and the Outbound Communications Manager business service are documented in Bookshelf's *Siebel Communications Server Administration Guide*.

Sending Email in a Workflow Process

- To send email from a Siebel workflow you must configure:
 - The email server
 - Create user accounts
 - Lab environment includes hMailServer, a free third-party mail server
 - Siebel Communications Server
 - Enable the Communications Management component group
 - Create a Profile record that specifies email settings
 - Create Communications Templates for email communications

More

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Communications Drivers and Profiles

- Siebel Communications Server accesses channels, such as email, fax, or messenger, through communications drivers
 - Driver parameters specify protocols (for example, SMTP) and basic settings (channel type, character set, and so on)
- Profiles are associated with a driver and extend or override driver parameters

The diagram illustrates the relationship between a **Communications Driver** and a **Communications Profile**. A red arrow points from the driver to the profile. To the right, a screenshot of the Siebel Administration console shows the 'Profiles' tab. It displays a table with one entry: 'Workflow Profile' associated with 'Default Organization'. Below this, the 'Profile Parameter Overrides' section shows a table of parameters for the 'Workflow Profile'.

Name	Value
From Address	siebel_workflow@localhost.com
POP3 Account Name	siebel_workflow@localhost.com
POP3 Account Password	siebel_workflow
POP3 Server	localhost
SMTP Server	localhost

A callout box points to the screenshot with the text: "Profile and profile parameters for the Internet SMTP/POP3 Server driver".

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Communications Drivers and Profiles

Communications drivers and profiles are configured in Administration - Communications > Communications Drivers and Profiles. In a practice, you will create the Workflow Profile shown. This profile includes a from address that is used in all workflow-generated emails, as well as server names for the POP3 (inbound) server and the SMTP (outbound) server.

Communications Templates

- Are used to create messages with substitutable fields
 - Example: The AUT Big Opportunity workflow will use a template that puts opportunity information in an email notification message

Template Properties

Name: * AUT Big Opportunity Notif

Channel Type: * Email

Template Type:

Language: * ENU

Locale: * ENU

HTML Template: ☐

Public: ☐

Compose Template

Subject: Big Opportunity

Text:

New Opportunity > \$1,000,000 in Submitted or later stage:

Name: [Opportunity.Name]
Account: [Opportunity.Account]
Revenue: [Opportunity.Revenue]
Primary on Sales Team: [Opportunity.Primary Sales Rep Login]
Sales Stage: [Opportunity.Sales Stage]

Fields are populated from current object (Opportunity)

Template includes substitutable fields

From: siebel_workflow@localhost.com **To:** siebel_user@localhost.com
Subject: Big Opportunity

New Opportunity > \$1,000,000 in Submitted or later stage:

Name: Test Opportunity
Account: Acme Company
Revenue: \$1,500,000.00
Primary on Sales Team: SADMIN
Sales Stage: Submitted

ORACLE

Testing and Deploying Workflow Processes

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Objectives

After completing this lesson, you should be able to:

- Test a Siebel workflow process using the workflow simulator
- Deploy a Siebel workflow process

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Managing Siebel Workflow Processes

- Workflow processes differ from most other object definitions
 - Are not compiled into a .srf
 - Can be exported to and imported from XML files
- After a workflow process has been configured in Siebel Tools:
 - Simulate the workflow
 - Deploy the workflow

ORACLE

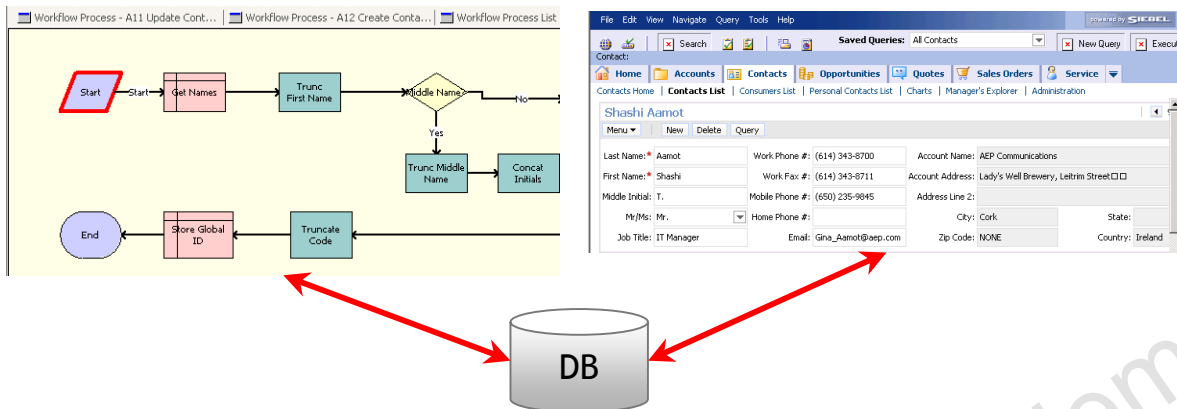

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Simulator

Using the Workflow Simulator is covered in Bookshelf's *Siebel Business Process Framework: Workflow Guide*, "For Developers: Testing a Workflow Process".

Workflow Simulator

- Use the workflow simulator to verify that the workflow performs as desired
 - Workflow simulation is controlled in Siebel Tools
 - Workflow is executed in an instance of a Siebel client
 - Tools and the Siebel client must be connected to a common database

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

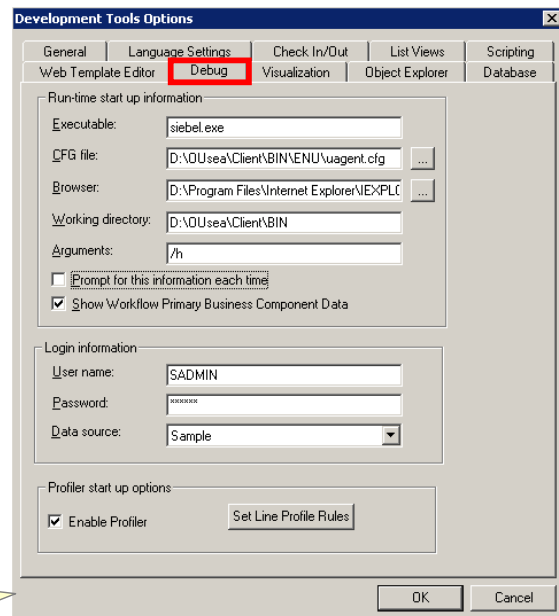

Workflow Simulator (continued)

Using the Workflow Simulator is covered in Bookshelf's *Siebel Business Process Framework: Workflow Guide*, "For Developers: Testing a Workflow Process".

Enabling Workflow Simulation

- Configure the connection to the Siebel run-time instance
 - In Siebel Tools, select View > Options > Debug
 - Simulator shares the parameters used by the Tools debugger
 - Specify the run-time Siebel instance
 - Provide a valid login

Parameters are used by the Workflow Simulator and the Tools script debugger

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Enabling Workflow Simulation

Debug Options

In View > Options > Debug, set:

- Executable: Location of siebel.exe for the Siebel Mobile Web Client or Siebel Developer Client
- CFG file: Location of Mobile/Developer Web Client configuration file
- Browser: Location of browser executable file
- Working directory: The Mobile/Developer Web Client binaries directory
- Arguments: Use the default, /h. This starts the client in Debug mode. In Debug mode, the Siebel client displays detailed debugging information when it encounters a run-time error.
- Login information: Login name, password, and data source

Testing a Workflow Using the Workflow Simulator

The steps to test a workflow process in the Siebel Tools Workflow Simulator are:

1. Specify the Test Record
2. Start the Simulator
3. Start the Simulation
4. Execute the Workflow

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Specify the Test Records

- In the Siebel client, create test records to support the simulation
 - Use Help > About Record to determine the Row Id
- In Siebel Tools, enter the Row Id of the test record as the Default String for the Object Id process property
 - When the workflow is invoked in production, the Row Id of the record is passed in as an input argument

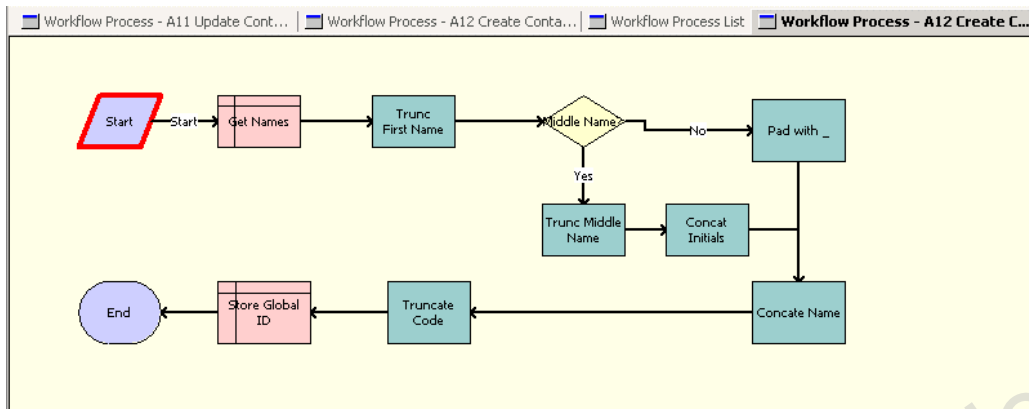

Multi Value Property Window								
Children of A12 Create Contact: 0								
Process Properties		Process Metrics						
Name	Display Name	In/Out	Changed	Business Object	Business Component	Virtual Field	Default String	Default Date
FirstName		In/Out	TRUE	Contact				
LastName		In/Out	TRUE	Contact				
MiddleInit		In/Out	TRUE	Contact				
MiddleName		In/Out	TRUE	Contact				
Object Id		In/Out	TRUE	Contact			12-WFJ4D	
Process Instance Id		In/Out	TRUE	Contact				
Siebel Operation O...		In/Out	TRUE	Contact				

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Start the Simulator

- Make sure that all instances of the Siebel client application are closed
- Right-click the Workflow Designer workspace and select Simulate
 - The Workflow Designer displays the workflow in the simulator window

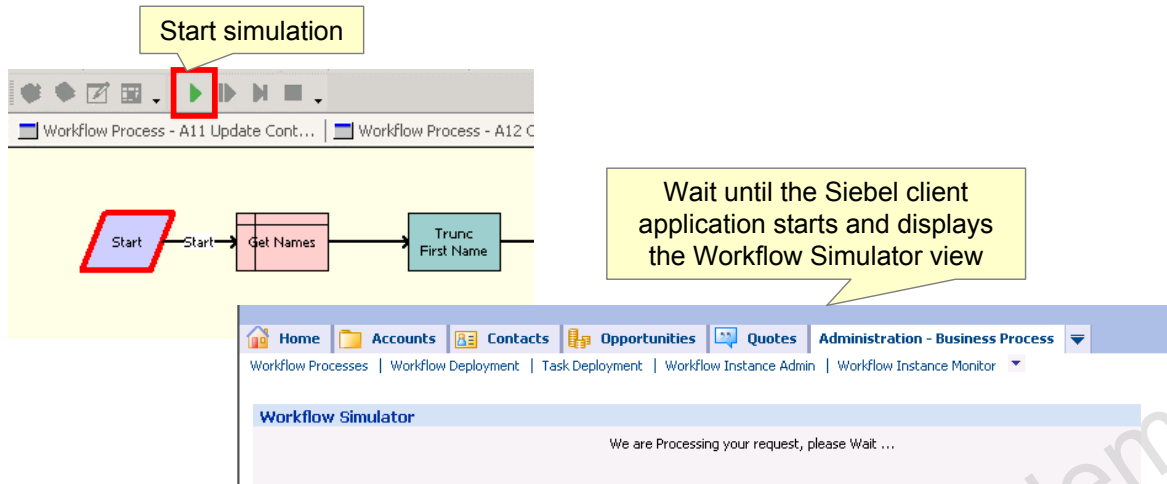

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Start the Simulation

- Click the Start Simulation button in the simulation toolbar
 - Use View > Toolbars > Simulation to display the simulation toolbar
- A new instance of the Siebel client is launched

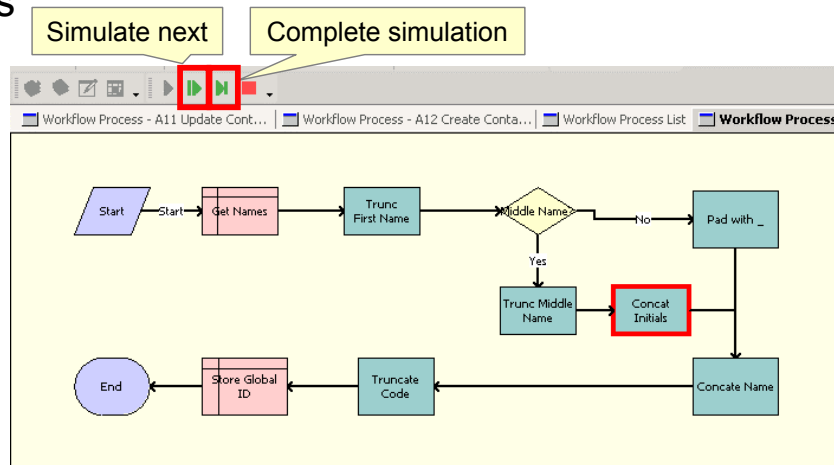

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Execute the Workflow

- Execute the workflow in either:
 - Single step mode using the Simulate Next button
 - Continuous mode using the Complete Simulation button
- Verify that the workflow branches correctly at decision steps

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Execute the Workflow: Using the Watch Window

- Inspect the watch window to verify that process properties have the expected values
 - Values of user added process properties can be edited during a simulation

Workflow Process Data

Simulator Status	Step Completed
Process Properties	
ContactCode	S
Error Code	
Error Message	
FirstName	Shashi
LastName	Aamot
MiddleInit	T
MiddleName	T.
Object Id	12-WFJ4D
Process Instance Id	6-48ZKB
Siebel Operation Object Id	12-WFJ4D
BusComp	Contact

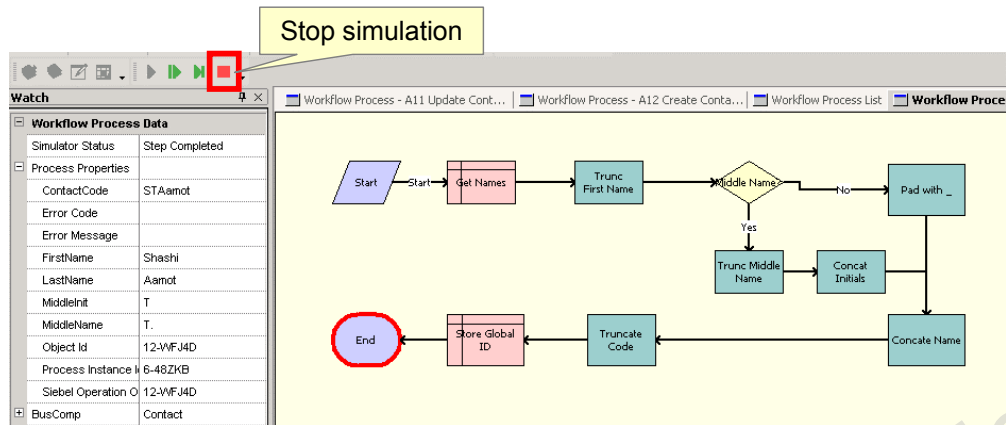

Inspect process properties in the watch window

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Execute the Workflow: Completing the Simulation

- Complete the simulation
 - Use either Simulate Next or Complete Simulation buttons
- Verify that the final values of process properties are correct
- Click the Stop Simulation button
- Inspect the client and verify the result

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Simulator Considerations

- Cannot simulate workflow processes that invoke server components
 - Must test these workflows directly in the Siebel Web Client
- Cannot simulate workflows with run-time events on start steps (discussed in a subsequent lesson)
- Can simulate workflows with user interact steps
 - Requires the developer to perform the activity in the client application to allow the simulation to proceed

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Simulator Considerations

One exception to the restriction on simulating workflow processes with server components is Assignment Manager. A later lesson covers this Siebel functionality, which can be invoked through the Business Service Simulator using the business service Synchronous Assignment Manager Requests. This business service can be simulated in a local, thick client, even though Assignment Manager invocation typically requires server components.

Deploying Workflow Processes

- Transfers the workflow from the repository to run-time tables to make it available for use
- Consists of:
 - Developer setting the workflow to complete in Siebel Tools
 - Publish the workflow
 - Check in the workflow's project
 - Administrator activating the workflow in the run-time client

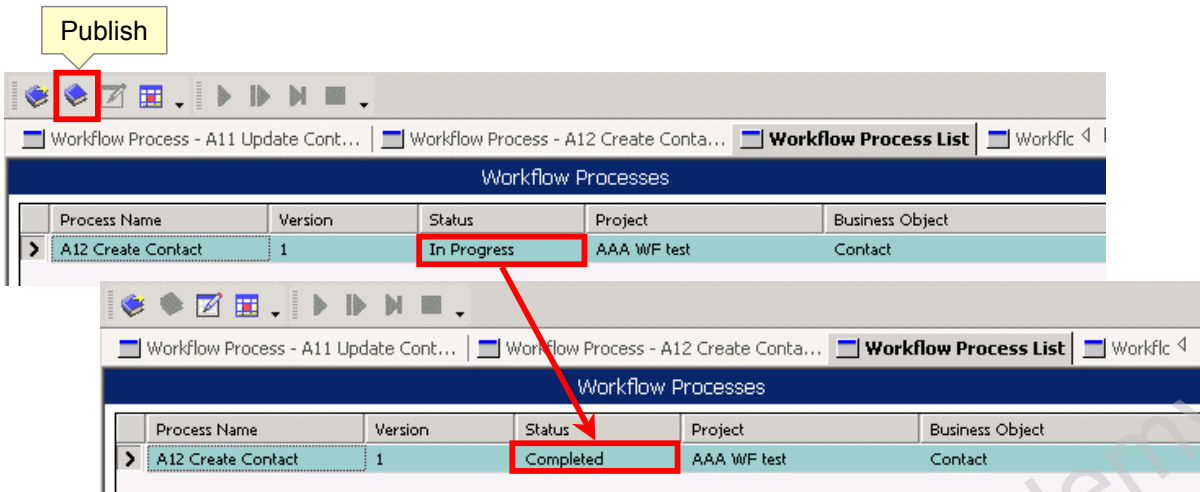

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Developer: Publish the Workflow

- In Siebel Tools, click Publish on the Workflow toolbar
 - Sets the status to Completed
 - Prevents any further editing of the workflow process
 - Makes the workflow available for activation

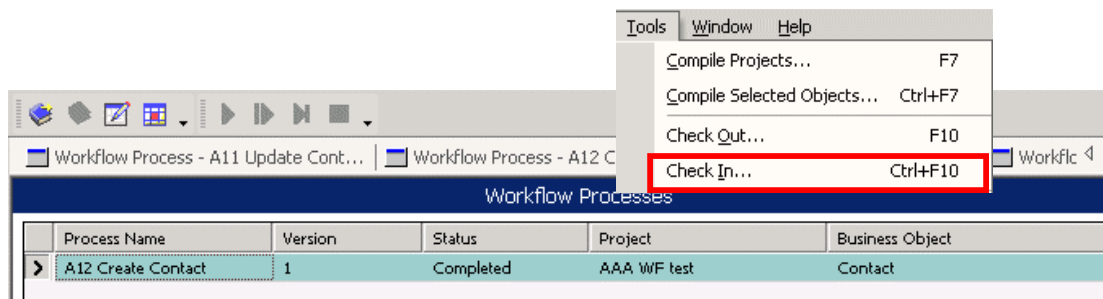

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Developer: Check In the Workflow Process

- In Siebel Tools, check in the completed workflow process to the server repository
 - Siebel Web Client can now access the workflow

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Administrator: Activate the Workflow

- In the Siebel Web Client, activate the workflow
 - Navigate to Business Process - Administration > Workflow Deployment
 - Select the newly deployed workflow and click Activate
 - Transfers the workflow definitions in the repository tables into corresponding run-time tables

Activated workflows appear in the Active Workflow Processes applet

The screenshot shows the Siebel Web Client interface. The top navigation bar includes links for Home, Accounts, Contacts, Opportunities, Quotes, and Administration - Business Process. The 'Administration - Business Process' link is selected, and the 'Workflow Deployment' sub-link is active. Below the navigation bar, there are two applets. The first applet, 'Repository Workflow Processes', has a table with columns: Name, Version, Business Object, Status, Group, and Mode. It lists two workflows: 'A12 Create Contact' (Version 1, Status Completed, Mode Service Flow) and 'AAA WF' (Version 0, Status Completed, Mode Service Flow). The 'Activate' button is highlighted in red. The second applet, 'Active Workflow Processes', has a table with columns: Name, Version, Repository Versic, Business Object, Group, Deployment Stat, and Activation. It lists two workflows: 'A12 Create Contact 1' (Version 0, Status Active) and 'A12 Create Contact 0' (Version 0, Status Outdated). The 'Active Workflow Processes' applet is highlighted in red.

Name	Version	Business Object	Status	Group	Mode
> A12 Create Contact	1	Contact	Completed		Service Flow
AAA WF	0		Completed		Service Flow

Name	Version	Repository Versic	Business Object	Group	Deployment Stat	Activation
> A12 Create Contact 1	0		Contact		Active	
A12 Create Contact 0	0		Contact		Outdated	

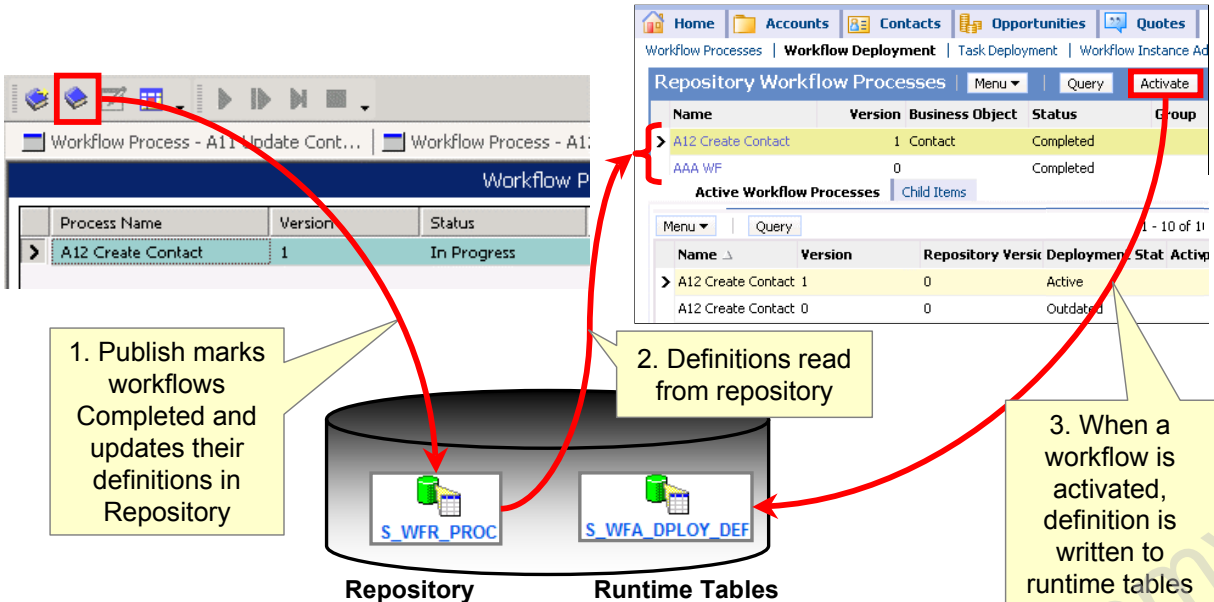

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Publishing and Activation: Summary

**Developer in
Siebel Tools**

**Administrator
in Siebel Client**

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

ORACLE

Workflow Publishing and Activation: Summary

Publish changes the workflow status from In Progress to Completed and writes the workflow definition to repository tables in the developer's local database. After the developer has completed publishing from Siebel Tools, the administrator continues the process in the client application. Step two shows that workflow definitions are read from the repository and displayed in the Workflow Deployment view. In step three, the administrator uses Activate, which writes the workflow definition to the runtime tables. Here they are stored as XML, for optimum performance, along with their deployment parameters.

This picture is simplified by omitting the Check In, which is done by the developer. This step copies the workflow repository information from repository tables in the developer's local database to corresponding tables in the server database. An administrator on the production server would have to activate these checked in workflows.

Using Publish/Activate to Speed Workflow Testing

- Developers can deploy and activate a workflow process from Siebel Tools to expedite testing
- In Siebel Tools, click Publish/Activate on the Workflow toolbar
 - Sets the workflow status to Completed
 - Transfers the workflow definitions in the repository tables into corresponding run-time tables
 - The client used for testing must use the same database as Siebel Tools

Publish/Activate

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Deployment Considerations

- Publish and activate all child workflows (sub processes) first to make them available to the deployed workflow
- Compile any new repository objects referenced in the deployed workflow such as business components, fields, and views

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Revising Workflows

- Workflows are versioned
- To revise a workflow:
 - In Siebel Tools, selected the desired workflow (check out if necessary)
 - Click the Revise button in the Workflow toolbar
 - Creates a copy of the workflow
 - Increments the version number
 - Sets the Status to In Progress
 - Edit, test, and deploy the workflow

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Administering a Revised Workflow

- In the Siebel Web Client, activate the workflow as before
 - Sets the deployment status of the prior version to Outdated
- After being activated the new version will be invoked
 - Any instances of the prior workflow version running at the time of activation run to completion

Active Workflow Processes [Child Items](#)

Menu ▾	Query	Query Results		
Name ▴	Version	Deployment Status	Monitoring Level	Business Object
> A12 Create Contact	2	Active	0 - None	Contact
A12 Create Contact	0	Outdated	1 - Status	Contact
A12 Create Contact	1	Outdated	1 - Status	Contact

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Lesson Highlights

- Use the workflow simulator to verify that the workflow behaves as designed
 - Workflow simulation is controlled in Siebel Tools
 - Workflow is executed in an instance of a Siebel client
- Deploy a workflow to make it available for use in the run-time client
 - In Siebel Tools, publish the workflow
 - In the run-time client, activate the workflow to make the workflow available for invocation
- Revise a deployed workflow to edit it
 - Creates a new version
 - Increments version number

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 3 Overview: Testing Siebel Workflow Processes

This practice covers the following topics:

- Testing a Siebel workflow process
- Importing and exporting a workflow process

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4

Siebel Workflow Architecture

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Describe the Siebel Workflow run-time architecture
- Describe the run-time environment of a workflow process
- Execute a workflow using the business service simulator
- Monitor workflow execution

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Executing Siebel Workflows

- All Siebel workflow processes are executed by the Workflow Process Manager business service
 - Is often referred to as the Workflow Engine
- This business service has two methods used to execute a workflow process
 - RunProcess: execute a specified workflow process for a given Row Id
 - RunBatch: execute a specified workflow process for a set of records designated by a search specification

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Executing Siebel Workflows

Reference

The Siebel Workflow run-time architecture is discussed in Bookshelf's *Siebel Business Process Framework: Workflow Guide*, "Introduction to Workflow Processes".

Workflow Process Manager (Server Request)

The Workflow Process Manager (Server Request) business service executes the Workflow Process Manager method RunProcess in the Workflow Process Manager server component. Technically, Workflow Process Manager (Server Request) is a second business service that executes a workflow process, but it offers a subset of Workflow Process Manager functionality.

Invoking a Workflow Process in the Business Service Simulator

- The Workflow Engine can be invoked in the Business Service Simulator
 - Is an alternative way of testing new workflows
 - Can be used for workflows that call server components

The screenshot displays the Business Service Simulator interface. At the top, there is a navigation bar with tabs for Home, Accounts, Contacts, Opportunities, Quotes, Sales Orders, Service, and Administration - Business Service. Below this is a sub-navigation bar with links for Details, Methods, Scripts, Simulator, and User Properties. The main area is divided into two sections: 'Service Name' and 'Input Arguments'.

The 'Service Name' section contains a table with the following data:

Service Name	Method Name	Iterations
Workflow Process Manager	RunProcess	

A callout box points to the 'RunProcess' method name, stating: "Business service that executes workflow processes".

The 'Input Arguments' section contains a table with the following data:

Test Case #	Type	Value	Child Type	Child Value	Property Name	Property Value
					ProcessName	A12 Create Contact

A callout box points to the 'ProcessName' property, stating: "Provide the name of the workflow process and an Object Id as input arguments".

ORACLE

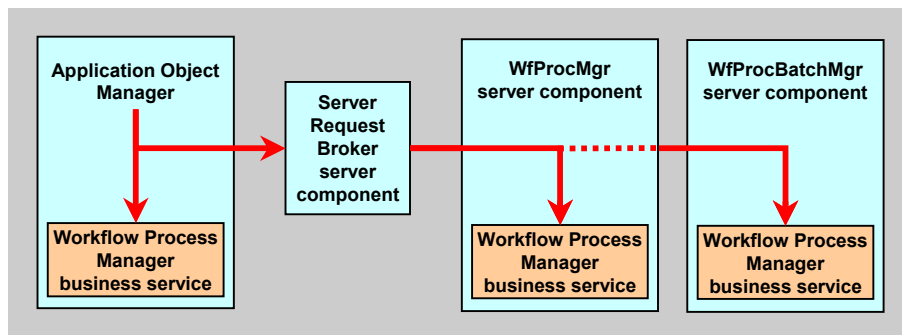

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking a Workflow Process in the Business Service Simulator

This method allows you to test workflows that can't be simulated. For example, a workflow process that requires the use of server components cannot be simulated, but could be tested in the business service simulator.

Server Components and the Siebel Workflow Engine

- Server components that invoke the Workflow Process Manager business service are:
 - Application Object Managers (AOMs)
 - Workflow Process Manager (WfProcMgr)
 - Workflow Process Batch Manager (WfProcBatchMgr)

More

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Server Components and the Siebel Workflow Engine

Component Groups

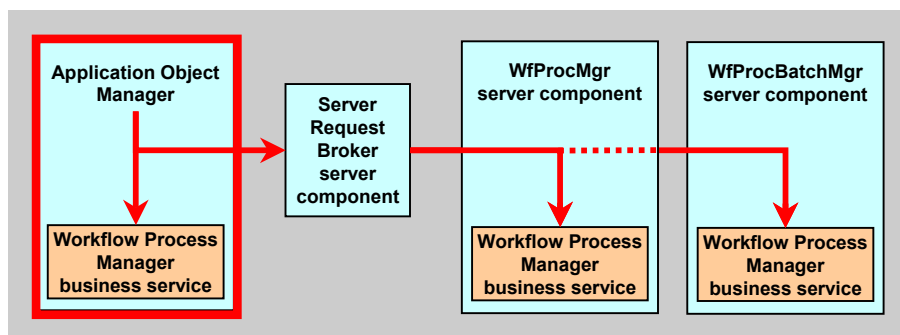

AOM server components belong to an application-specific component group. For example, the Siebel Call Center AOM, SCCObjMgr_enu, belongs to the Call Center component group. Both Workflow Process Manager and Workflow Process Batch Manager belong to the Workflow Management component group.

Terminology

This lesson will sometimes refer to the Workflow Management server components by their aliases, WfProcMgr and WfProcBatchMgr, to avoid confusion with the Workflow Process Manager business service.

Application Object Managers (AOMs)

- Can execute a workflow by:
 - Calling the Workflow Process Manager business service directly
- Usually execute workflow processes that are invoked by a run-time event
 - Covered in a subsequent lesson

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Application Object Managers (AOMs)

Remote Processing Mode

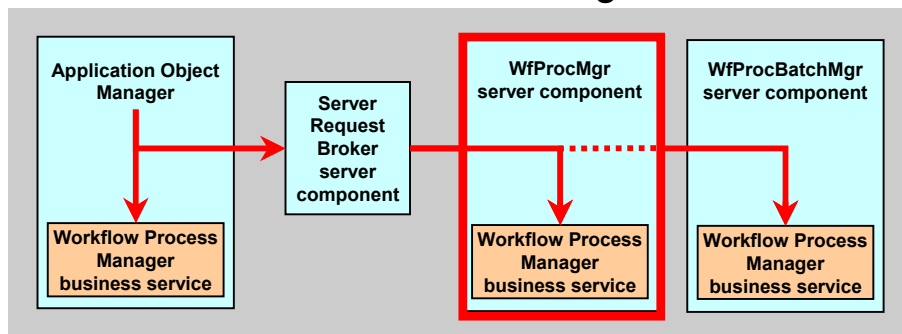

The AOM will dispatch workflow execution to the Workflow Process Manager server component if workflow's triggering runtime event has Processing Mode set to Remote Synchronous or Remote Asynchronous. Configuring runtime events in workflow processes is the topic of a later lesson.

Server Request Broker

The Server Request Broker is a server component that routes requests between clients and server components. For more details on this component, refer to Bookshelf's *Siebel System Administration Guide*, "Siebel Server Infrastructure Administration".

Workflow Process Manager (WfProcMgr)

- Is a server component configured to run the Workflow Process Manager business service efficiently
 - Belongs to the Workflow Management component group
- Uses the Siebel Object Manager framework
 - WfProcMgr has access to business objects and runtime events
- Calls the Workflow Process Manager business service

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Process Manager (WfProcMgr)

Executing a Workflow Process in WfProcMgr

There are several ways to execute a workflow with WfProcMgr:

- By a runtime event, where the event's processing mode is set to Remote Synchronous or Remote Asynchronous
- Through a workflow policy
- In a script

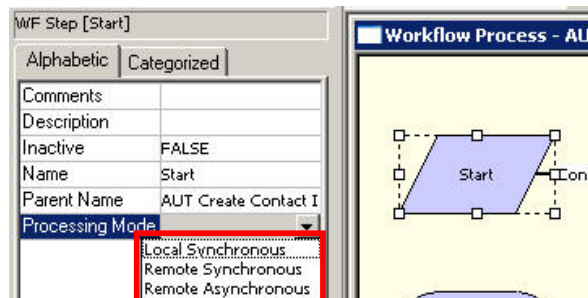

The first two of these ways are discussed in later lessons.

WfProcMgr/WfProcBatchMgr Caveat

Business services calling UI functions, including navigation functionality such as the User Interact step, are not supported when workflows are run by WfProcMgr or WfProcBatchMgr.

Dispatching Workflow Execution to WfProcMgr

- The AOM will dispatch workflow execution to WfProcMgr by:
 - Calling the Workflow Process Manager (Server Request) business service, which dispatches execution to WfProcMgr by way of the Server Request Broker component
 - If the workflow's Processing Mode is Remote Synchronous or Remote Asynchronous
 - Processing Mode is a property of the workflow's Start step

ORACLE

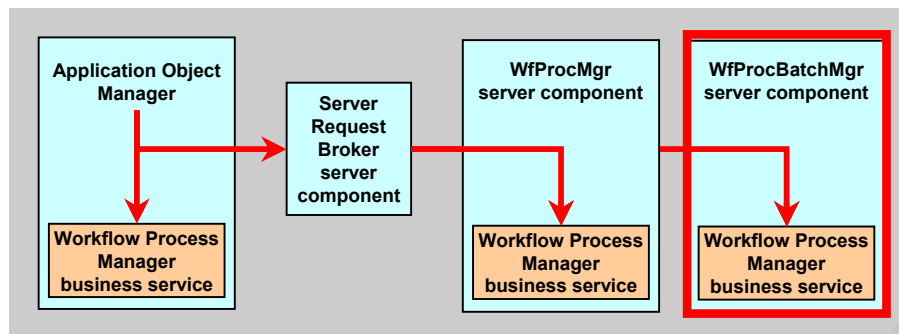

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Dispatching Workflow Execution to WfProcMgr

If Processing Mode is Remote Synchronous, then the request to the Workflow Process Manager server component is for synchronous execution. Control will be returned to the user session after the workflow completes. If Processing mode is Remote Asynchronous, then the request will be for asynchronous execution, and the user session will proceed while the workflow executes.

Workflow Process Batch Manager (WfProcBatchMgr)

- Is a server component configured to execute the Workflow Process Manager business service on multiple objects
- Uses the Siebel Object Manager framework
- Requires a workflow process name and a search specification identifying objects to run workflow on
 - Example: Process Name is AUT Create Contact Identifier and search specification is “[LastName]=‘B*’ ”

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Process Batch Manager (WfProcBatchMgr)

A workflow batch request may be submitted as a server request in the Administration - Server Management screen. For details, refer to Bookshelf's *Siebel Business Process Framework: Workflow Guide*, "For Developers: How Workflow Processes Are Designed" and *Siebel System Administration Guide*.

Synchronous versus Asynchronous Execution of Workflows

- Synchronous workflow execution occurs in the AOM or WfProcMgr
 - Can be triggered by an action on the part of the user:
 - Directly by clicking a button or menu item
 - Indirectly by performing a record or applet operation
 - User is forced to wait until the workflow completes (or pauses)
 - Hourglass icon appears
- Asynchronous workflow execution occurs in WfProcMgr or WfProcBatchMgr

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Synchronous versus Asynchronous Execution of Workflows

Examples of synchronous workflow execution:

- In response to a runtime event, such as a record being written
- By a custom control, such as a button.

Example of asynchronous workflow execution:

- By a workflow policy in response to a condition being met, such as a time interval elapsing

Other Workflow Management Server Components

- Generate Triggers
- Workflow Monitor Agent
- Workflow Action Agent
- Workflow Recovery Manager
 - Identifies workflows interrupted due to server failure
 - Forwards these workflows to a workflow engine to resume execution

Used with Workflow Policies
(discussed in a subsequent lesson)

Workflow
Management
component
group

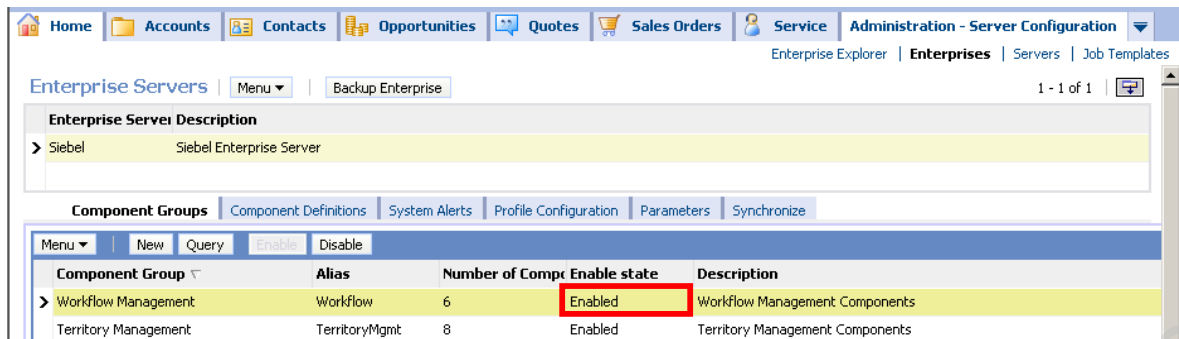

Components		Menu ▾	Query	Query Results
Component		Alias		
> Generate Triggers		GenTrig		
Workflow Action Agent		WorkActn		
Workflow Monitor Agent		WorkMon		
Workflow Process Batch Manager		WfProcBatchMgr		
Workflow Process Manager		WfProcMgr		
Workflow Recovery Manager		WfRecvMgr		

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Enabling Workflow Management Server Components

- Navigate to Administration - Server Configuration > Enterprises > Component Groups
- Enable the Workflow Management component group on the enterprise
- Assign and enable the component group on a server

ORACLE

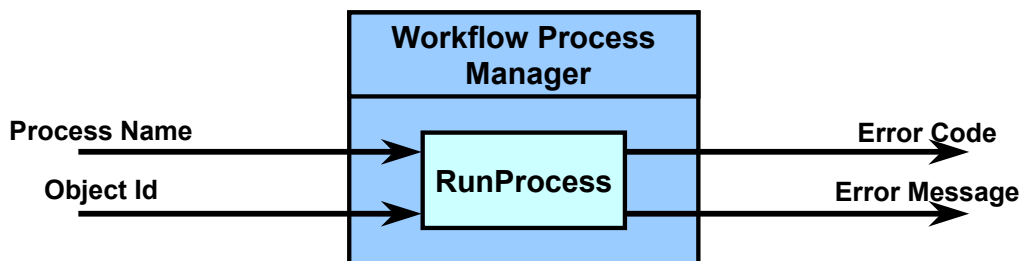

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Enabling Workflow Management Server Components

If the Workflow Management component group is not enabled as part of installation, it can be enabled using the Administration - Server Configuration screen.

Workflow Process Run-Time Environment: Input and Output Arguments

- The Workflow Process Manager business service invokes a workflow process with the method RunProcess with:
 - Input arguments
 - Process Name: name of the workflow process
 - Object Id: the current Row Id
 - Output arguments
 - Error Code: a code designating an error condition
 - Error Message: a string describing an error condition

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Process Run-Time Environment: Input and Output Arguments

Error handling is discussed in the next lesson.

The Role of a Workflow's Business Object

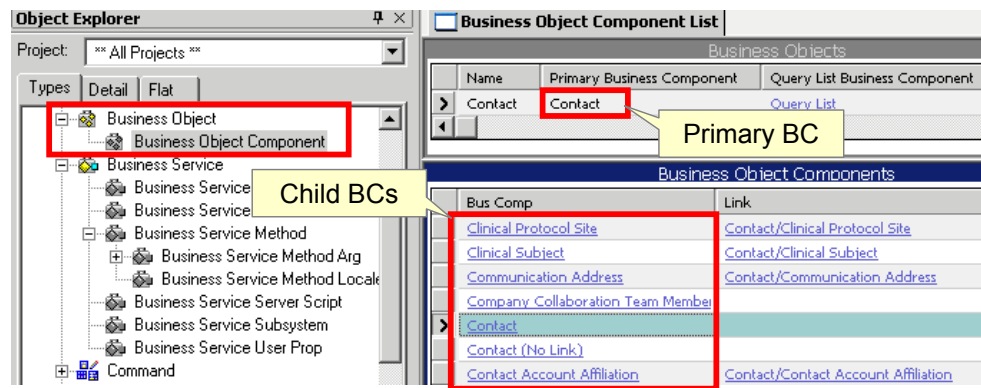

- The Row Id of the current record is passed to the RunProcess business service method
- The method queries the primary business component (BC) of the workflow process' business object for a matching Row Id
- Example:
 - RunProcess is passed the input arguments:
 - Object ID: 1-YR1
 - Process Name: AUT Create Contact Identifier
 - AUT Create Contact Identifier workflow has Business Object property = Contact
 - The primary BC of the Contact business object is the Contact BC
 - RunProcess queries the Contact BC for Row Id = 1-YR1

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Caveats on Business Components

- A workflow process can use any BC that is a child or primary BC of the workflow's Business Object property
- To access any other BC, use a Sub Process step
 - Sub process workflow operates on a business object that accesses the desired BC

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Monitoring

- Navigate to Business Process - Administration > Workflow Deployment
 - Select the active workflow process
 - Set the monitoring level in the active workflow process as required
 - The value assigned is used whenever the workflow process is invoked or resumed

Active Workflow Processes Child Items

Menu ▾	Query				
Name ▴	Version	Deployment Status	Monitoring Level		Business Object
> A12 Create Contact 1		Active	1 - Status ▾		Contact
A12 Create Contact 0		Outdated	0 - None		Contact
AAA WF 2		Active	1 - Status		
AAA WF 0		Inactive	2 - Progress		
AAA WF			3 - Detail		
AAA WF 1		Outdated	4 - Debug		
			0 - None		

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Monitoring Level

- Set monitoring level to record the needed amount of detail
 - Performance will degrade as the amount of detail increases

Levels	Record Process Instance	Record Step Instance	Record Process Properties
0-None	N	None	None
1-Status	Y	None	None
2-Progress	Y	All steps	None
3-Detail	Y	All steps	All steps
4-Debug	Y	All steps	All Steps

Data is written at the completion of the workflow

Data is written after each step

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Monitoring Workflow Execution

- To examine a workflow's execution:
 - Set the workflow's Monitoring Level above "0 – None"
 - Execute the workflow
 - Navigate to Administration - Business Process > Workflow Instance Monitor > Aggregate Data
 - Identify the correct instance and explore workflow and step data

The screenshot displays the Siebel Workflow Instance Monitor interface. The top navigation bar includes links for Workflow Policies, Workflow Policy Actions, Workflow Policy Explorer, Workflow Policy Groups, Workflow Policy Log, and Workflow D. The main content area is divided into two sections: Process Instance and Step Instances.

Process Instance Section:

- Instance Id: 1-3XVD
- Name: AUT Create Contact Identifier
- Version: 0
- Workflow Type: Service Flow
- Current Step: End
- Instance Type: Main Process
- Start Date: 9/1/2008 11:42:08 PM
- End Date: 9/1/2008 11:42:09 PM
- Root Instance: 1-3XVD
- Resume Date:
- Owner Id:

Step Instances Section:

Step Name	Status	Start Date	End Date
> Save Identifier	Running	9/1/2008 11:42:08 PM	9/1/2008 11:42:08 PM
Save Identifier	Running	9/1/2008 11:42:08 PM	9/1/2008 11:42:08 PM

Process Properties Section:

Property Name	Type	Property Value
> ContactCode	String	ZZimmer
Error Code	String	
Error Message	String	
FirstName	String	Zoe
Initial	String	Z
LastName	String	Zimmer
Object Id	String	1-3XQW
Process Instance Id	String	1-3XVD
Siebel Operation Ob	String	1-3XQW
Triggering Event	String	1-3P53

A red arrow points from the "Save Identifier" step in the Step Instances table to the Process Properties table.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Lesson Highlights

- Workflow processes are executed by the Workflow Process Manager business service
- Server components that call the Workflow Process Manager business service are:
 - Application Object Managers (AOMs)
 - Workflow Process Manager server component
 - Workflow Process Batch Manager server component
- Most new workflow processes should have a Workflow Mode of Service Flow
- A workflow process can use any business component (BC) that is a child or primary BC of the workflow's Business Object property

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 4 Overview: Exploring Siebel Workflow Architecture

This practice covers the following topics:

- Execute the Workflow Process Manager business service
- Run a Workflow Process Batch Manager job

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

5

Building Robust Workflows

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Use a Sub Process step in a workflow
- Handle errors in a Siebel workflow process
- Query in a Siebel Operation step

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Building Robust Workflows

- To produce more robust, scalable workflow processes, use:
 - Sub Process steps
 - Package workflow steps for reuse
 - Error handling
 - Anticipate and handle errors in the workflow
 - Respond correctly to system errors
- Querying is supported in workflows
 - Preferable to scripting

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Sub Process Steps

- Allow a segment of a workflow process to be bundled for reuse in other workflows
 - Used for a sequence of steps that is repeated in other workflow processes
 - Can use the calling workflow process' process properties
- Can be executed as a "stand-alone" workflow process
- Example: The eSales - Checkout Process calls several sub processes

ORACLE

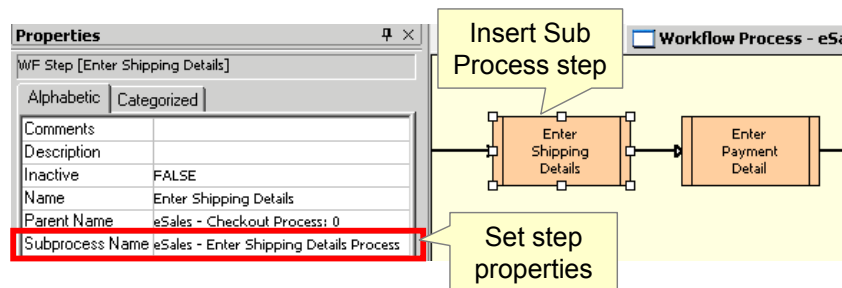

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Sub Process Steps

Sub Process Steps are documented in the *Siebel Business Process Framework: Workflow Guide*, "About Workflow Process Step Types".

Creating a Sub Process: Step Properties

- Create the sub process the same way as any other workflow
- When creating the calling workflow process in the Workflow Designer:
 - Insert a Sub Process step
 - Set the step's Name and Sub Process Name properties
 - Double-click the step to open the sub process in the Workflow Designer

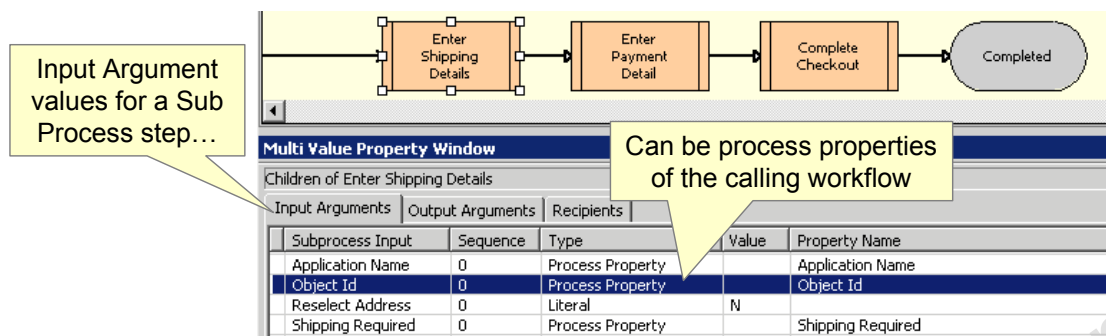

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Creating a Sub Process: Input and Output Properties

- Input and output arguments for a Sub Process step are specified in the Multi Value Property Window (MVPW)
- Can map the parent workflow's process properties to Sub Process input arguments
- Can map Sub Process output arguments to parent process properties

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Passing Data to a Sub Process by Reference

- By default, input arguments are passed to a sub process step by value
 - Values are copied to a separate instance in the sub process and copied back upon completion of the sub process
- For passing sizeable hierarchy type properties, such as large property sets, pass by reference
 - Pass a pointer to the argument, rather than copying values
- In the sub process workflow, set the Pass By Ref Hierarchy Argument property to TRUE
 - All hierarchical input arguments to the workflow will be passed by reference

Workflow Processes			
	Process Name	Status	Pass By Ref Hierarchy Argument
>	PPR Can Apply To Partner Program Process	Completed	✓
	PPR Can Renew Program Membership Process	Completed	✓
	eSales - Checkout Process	Completed	
	eSales - Complete Checkout Process	Completed	

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Passing Data to a Sub Process by Reference

Input and output arguments to a workflow have a Data Type property, which may have a value of Hierarchy. The Pass By Ref Hierarchy Argument workflow property only affects input arguments of that type.

Error Handling

- Workflows may encounter errors:
 - User-defined errors
 - Example: An incorrect or outdated recipient address when sending email
 - System errors
 - Example: When attempting to send email, the mail server may be down
- If the error is not handled, then workflow execution will stop and an error message will be displayed to the user (if any)
- Siebel Workflow includes two mechanisms for handling errors in workflow processes:
 - An Error Process
 - An Error Exception connector

More 

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Error Handling

Error handling in workflows is documented in the *Siebel Business Process Framework: Workflow Guide*, “For Developers: How Workflow Processes Are Designed”.

Error Process Name Workflow Property

- Is a workflow to handle all errors in a parent workflow process
 - Any error that occurs in the parent workflow will cause the error workflow to be called
 - Error workflow can try to handle the error condition
 - Example: wait for 30 seconds and then resend email
- To use an error workflow:
 - Create the error workflow
 - Set the Error Process Name property in the parent workflow

The diagram illustrates the relationship between a parent workflow and its error handling process. A yellow callout box labeled "Parent workflow" points to the first two rows of the "Workflow Processes" table. A second yellow callout box labeled "WF that will run when parent encounters an error" points to the "Error Process Name" column, specifically highlighting the "ISSErrHandler" value in the third row.

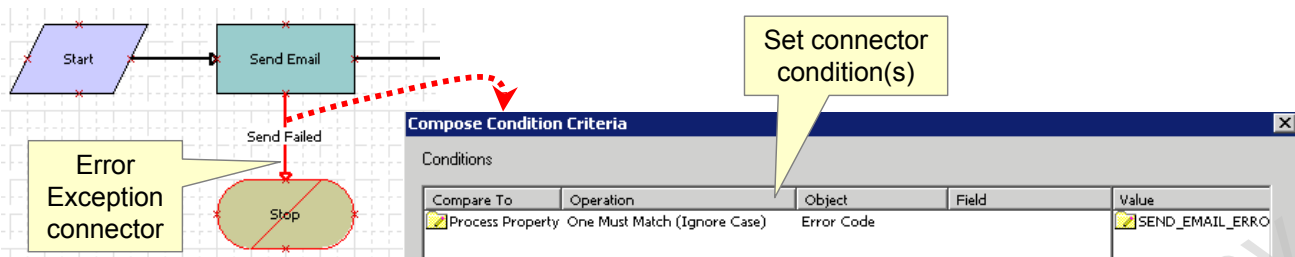

Workflow Processes		
Process Name	Status	Error Process Name
FINS Claims Submit Payment Process	Completed	FINS Claims Submit Payment Error
ISS Build Load File	Completed	ISSErrHandler
ISS Delete Record Sync	Completed	ISSErrHandler

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Error Exception Connector

- Use an Error Exception connector to try handling an error
 - Subsequent steps can attempt recovery from the error
- Attach to Business Service or Siebel Operation step
 - Define connector conditions to specify the error
 - Similar to defining connector conditions for a Decision Point step
 - Example: On send email failure, wait and resend
 - Use Error Exception connector to avoid suspension of workflow

ORACLE

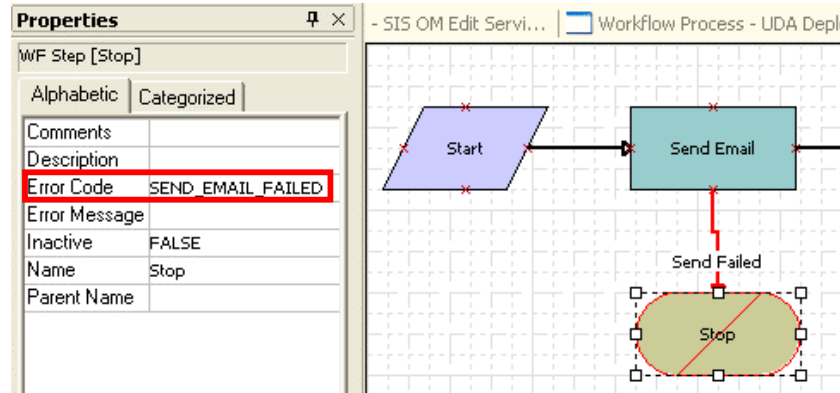

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Error Exception Connector

The workflow segment terminated with a stop step will stop execution on the error specified by the connector condition shown on the right. In this example, the error is considered unrecoverable.

Stop Step

- If a Stop step terminates an Error Exception branch, set the step's Error Code property to return a descriptive code
 - Returned to the caller of the workflow (if any)

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Behavior on Error Conditions

- If no error handling is specified for a workflow, then on error:
 - Execution of the workflow stops
 - Workflow state is set to “In Error”
 - Error code is returned to the caller of the workflow process
- If an error process is specified for the workflow and:
 - The error process reaches its End step, then the calling workflow continues from where the error occurred
 - A different error occurs in the error process workflow, then:
 - Parent workflow is suspended and remains in “In Error” state
 - A new error code is returned to the caller of the parent workflow

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Errors in Sub Processes

- A Sub Process step may encounter an error
- If the sub process does not handle the error with an error process or Error Exception connector, then the sub and parent process terminate execution
 - Error code is returned to the caller of the parent process
- If the sub process has an error process defined and:
 - The error process handles the error successfully by reaching its End step, then:
 - The sub process executes from the step where the error happened
 - A different error occurs in the error process workflow, then:
 - Sub process and parent exit and have state “In Error”
 - New error code is returned to the caller of the parent workflow

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Querying in Workflow Processes

- Siebel Workflow supports querying using a Siebel Operation step
- A query creates a record set containing matching records
 - Use NextRecord and PreviousRecord Siebel operations to navigate a record set
- There are two query Operations:
 - Query: only supports navigation with NextRecord
 - QueryBiDirectional : supports NextRecord and PreviousRecord

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Querying in Workflow Processes

Bidirectional Query

QueryBiDirectional, must be used if you wish to move backwards through a record set using PreviousRecord. The record set returned by Query only supports forward movement using NextRecord.

Looping Through a Record Set

- Siebel operations have two output arguments that can be used to control looping through the record set
 - Query operation has an output argument, NumAffRows, that specifies the number of rows matching the query
 - NextRecord and PreviousRecord have an output argument, NoMoreRecords, that is set to TRUE when the end of the record set is reached
- Map these output arguments to process properties, which can be used in Decision Step connector conditions

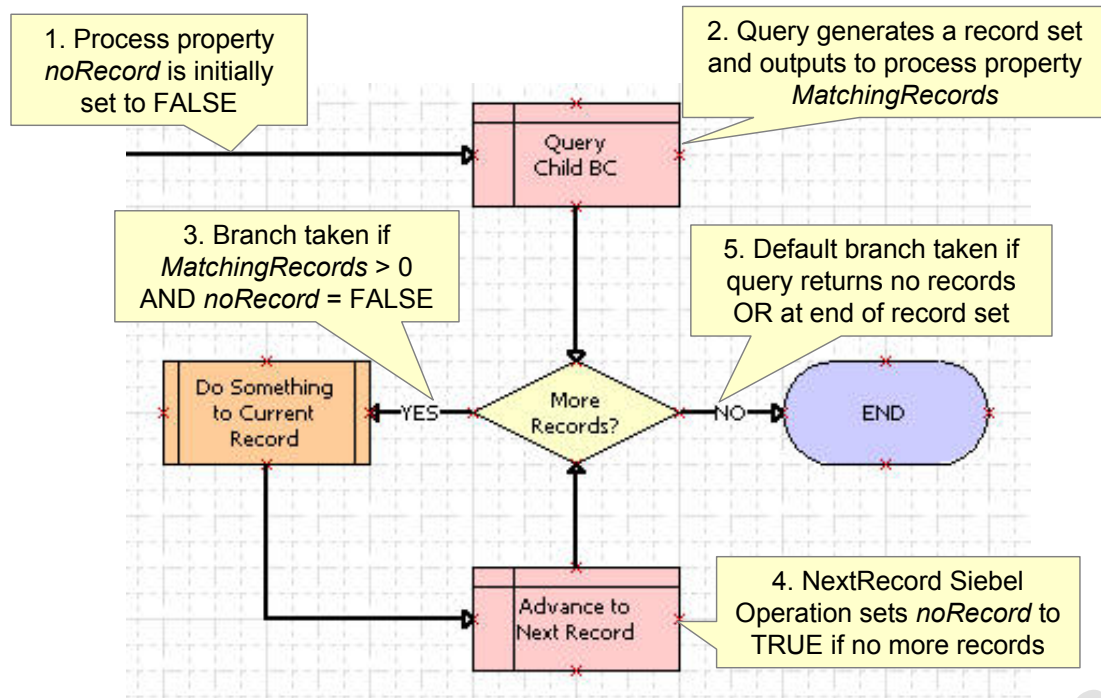

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Looping Through a Record Set

The process property names shown in the diagram are examples, and are meant to suggest their use.

Query and Looping Example

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Query and Looping Example

Process Properties for Queries

A workflow that loops through a record set will use two process properties: one to record the number of records returned by the query, and the other to indicate if there are no more records to process in the record set. In the example above, `noRecord` is a process property that is initially set to FALSE and then set to the output argument of the `NextRecord` step. This process property will remain FALSE until `NextRecord` determines that the record set has no more records. The second process property, `matchingRecords`, is not shown in the example above. This numeric property is initially zero, and is set equal to the number of records returned by the query through the `NumAffRecords` output argument. The branch logic in step 3 has been simplified to use this output argument, but it will actually use the process property `matchingRecords` instead.

End Step

The example workflow shows an end after the loop, but there is no requirement that the workflow process terminate after looping through a record set. Additional workflow logic could follow the exit from the loop.

Setting a Search Specification

- Set the search parameters for a query in the MVPW:
 - Filter Business Component: the name of the queried business component; on left side of the search specification
 - Type: type of search specification - Literal or Expression
 - Expression Business Component: if Type is Expression, then the fields that appear on the right side of the search specification are from this business component
 - Search Specification: the search specification
- Example: search for accounts for a specified contact

Field Input Arguments		Search Spec Input Arguments	Output Arguments	
Expression Business Component	Sequence	Filter Business Component	Type	Search Specification
Contact	1	Account	Expression	"[Id] = [Account Id]"

Search specification evaluates to:
[Account.Id] = [Contact.Account Id]

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Setting a Search Specification

Filter Business Component

An important restriction on the value of the filter business component is discussed in an upcoming slide.

Example

In the example shown, fields of the Filter BC, Account, appear on the left hand side of the search specification. Because Type has value Expression, fields that appear on the right hand side belong to the Expression BC, Contact.

Search Specification Syntax

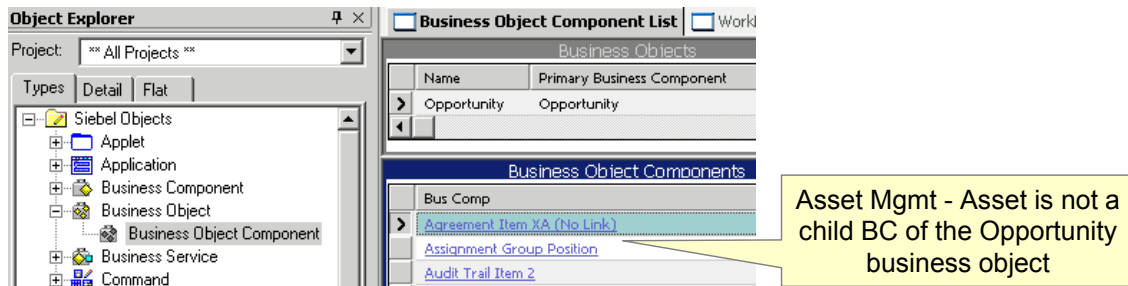

- Search specifications use the same operators and expressions as queries in the Siebel Client or Tools
 - Operators: =, <>, >, <, IS NULL, IS NOT NULL, AND, OR, and so on
- Special syntax for search specifications:
 - Surround search specification with double quotes
 - Use brackets, [], to refer to fields
 - Example: [Last Name]
 - Use & to refer to process properties
 - Example: [&Object Id]
 - Use single quotes, ', to specify string literals
 - Example: "[Last Name] LIKE 'Z*' "

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

A Restriction on Query Operations

- A Query step can only query a child business component of the workflow process' Business Object
 - Example: A workflow that acts on Opportunity cannot query on the Asset Mgmt - Asset business component
 - Asset Mgmt - Asset is not a child BC of the Opportunity business object

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Querying the Primary Business Component

- A workflow process cannot query on the workflow's primary business component
 - Example: if a workflow has Business Object = Opportunity, then it cannot query for Opportunities with Name LIKE 'A*'
- Workaround to allow queries on the parent/primary BC:
 1. Create a new child business component that uses the same base table as the primary business component
 - Example: Create a new business component Opportunity No Link that uses S_OPTY, which is the base table for Opportunity
 2. Add fields to the new child BC for all parent fields required in the query or loop operations
 - Example: create Name field and others as needed in subsequent operations on the record set
 3. Add the new BC as a child BC of the business object

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Querying the Primary Business Component

The new child business component does not need a link definition, which is why the example child BC is named Opportunity No Link.

Alternatives to Querying the Primary Business Component

Many times a query on a primary business component is unnecessary. For example, consider a workflow process acting on Service Request (SR) that queries for SRs older than three years with no resolution, then loops through the record set and sets the State of each SR to Inactive. An alternative would be a workflow that operates on a single SR, designated by the Object Id process property. This workflow simply sets the SR State to Inactive. Execute this workflow by executing a Workflow Process Batch Manager job with a search specification that looks for records older than three years with no resolution. This alternative would not require the configuration given here.

Lesson Highlights

- Use Sub Process steps to call a workflow process from a parent workflow
 - Can reuse functionality
 - Reduces complexity of workflows
- Define input and output arguments for a Sub Process step
 - Can pass process properties from the parent workflow
- Handle errors in workflow processes using:
 - An error process: tries to handle all errors in a workflow
 - An Error Exception connector
 - Is a branch from a Siebel Operation or Business Service Step
 - May have conditions
- A query in a workflow returns a record set
 - Use NextRecord and PreviousRecord to access the records

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

6

Invoking Workflow Processes: Runtime Events and Custom Controls

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- List several ways to invoke workflow
- Invoke a workflow process using a run-time event
- Invoke a workflow process using a custom control
- Invoke a workflow process in a script

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking Workflow Processes

- A workflow process can be invoked by a variety of mechanisms
 - Run-time events
 - Custom buttons and menu items
 - Workflow policies
 - Covered in the next lesson
 - Programmatically, from a script

More 

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking Workflow Processes

Invoking Workflows from a Script

A common way to invoke a workflow process from a script is to execute the RunProcess method of the Workflow Process Manager business service. This course, in the scripting section, includes a practice where you will execute a business service method from a script.

Run-Time Events

- Are a mechanism that allows customer-configured processing to be triggered by user activity
- Consist of:
 - A specification of some user activity such as:
 - A record being updated
 - Navigating to or from an applet
 - The resultant processing:
 - Execution of a workflow process
 - Calls to one or more business services
 - Known as an action set

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Run-Time Events

Run-time events were introduced as part of Siebel Personalization and are described in Bookshelf's *Siebel Personalization Administration Guide*, "Tracking Run-Time Events".

Run-Time Events: Object Types

- Can be defined for three types of objects:
 - Application
 - Examples: logging in, logging out
 - Applet
 - Examples: displaying an applet, displaying a record
 - Business component
 - Examples: Querying, deleting a record, setting a field value
- Are fired when a user performs the corresponding activity

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Business Component Events

- Business component events often come in pairs, such as:
 - PreDelete/Delete
 - PreSetField/SetField
 - PreWriteRecord/WriteRecord
- The Pre- event is fired immediately prior to the Object Manager executing the operation
 - Example: PreWriteRecord executes before a record is saved
 - Allows for possible verification of field values
- The other event is fired immediately after the object manager executes the action
 - Example: WriteRecord executes custom processing after the record is written
 - Allows for follow-on processing after a record is saved

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Adding a Run-Time Event to a Workflow Process

- A run-time event can be added to a workflow process as a condition on the connector out of a:
 - Start step
 - Used to invoke the workflow
 - Wait step
 - Used to resume the workflow
 - User interact step
 - Used to resume the workflow

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Adding a Run-Time Event to a Workflow Process

Reference

Adding run-time events to workflow processes is discussed in Bookshelf's *Siebel Business Process Framework: Workflow Guide*, "For Developers: Understanding How Workflow Processes Are Designed".

User interact steps

User interact steps are a part of Interactive Flow workflows, which have been mostly supplanted by Siebel Task UI. Task UI is covered in later lessons.

Using a Run-Time Event to Invoke a Workflow

- Required steps for using a run-time event to invoke a workflow process are:
 1. Add the Run-Time Event
 2. Publish and Activate the Workflow
 3. Reload Run-Time Events

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Add the Run-Time Event

- Create the workflow process
- Select the connector to attach the run-time event
 - Must originate from a Start, Wait, or User interact step
- In the Properties window, specify the triggering event
- Caution: A workflow with a run-time event on the start step cannot be tested with the workflow simulator

The screenshot displays the Siebel Workflow Designer interface. On the left, the 'Properties' window is open for the 'WF Step Branch [Start]'. The 'Comments' tab is selected, and a red box highlights the 'Event' section, which includes the following properties:

Event	WriteRecordNew
Event Cancel Flag	FALSE
Event Object	Contact
Event Object Type	BusComp
Event Visibility	Enterprise
Inactive	FALSE
Name	Start

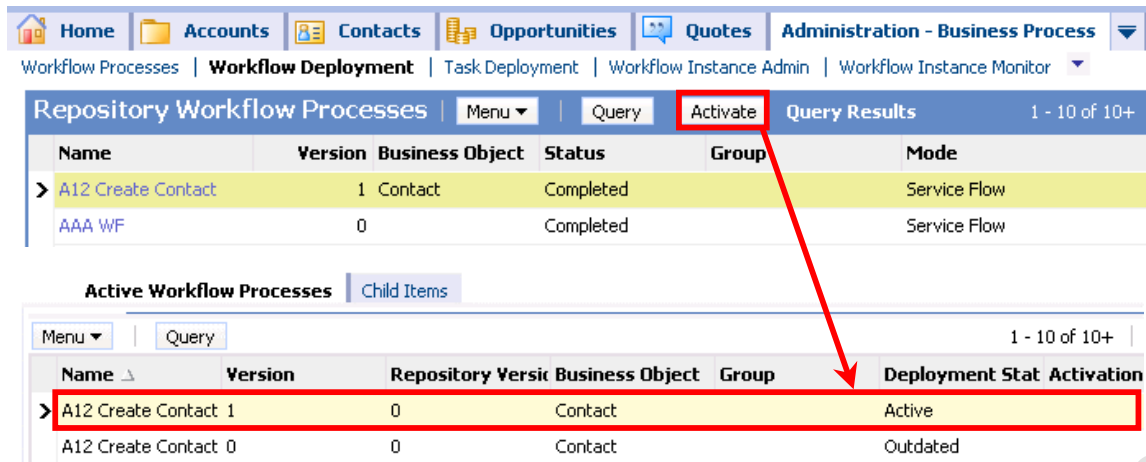

On the right, the 'Workflow Process - A12 Create C...' window shows a workflow diagram. A yellow callout box labeled '1. Select the connector' points to the connector between the 'Start' step and the 'Get Names' step. Another yellow callout box labeled '2. Specify the event type, business component, and event to monitor' points to the 'Get Names' step.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Publish and Activate the Workflow

- In Siebel Tools, publish the workflow
- In the Siebel client, activate the workflow

The screenshot displays the Siebel client interface for workflow management. The top navigation bar includes links for Home, Accounts, Contacts, Opportunities, Quotes, and Administration - Business Process. The 'Workflow Deployment' section is active, showing 'Repository Workflow Processes' and 'Active Workflow Processes' tables.

Repository Workflow Processes

Name	Version	Business Object	Status	Group	Mode
> A12 Create Contact	1	Contact	Completed		Service Flow
AAA WF	0		Completed		Service Flow

Active Workflow Processes

Name	Version	Repository Versic	Business Object	Group	Deployment Stat	Activation
> A12 Create Contact 1	0		Contact		Active	
A12 Create Contact 0	0		Contact		Outdated	

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Deploy and Activate the Workflow: Run-Time Events

- Activating the workflow automatically registers the run-time event and associated workflow with the Siebel run-time event engine
 - Creates an action set that invokes the Workflow Process Manager

Action Sets | Menu | New | Delete | Query

Name	Start Date	End Date	Active	Enable Export	Description
Workflow_1-3PS2			✓		

More Information | Menu | 1 of 1

Row ID of activated workflow: Workflow_1-3PS2

Business Service and method to invoke: Business Service Name: Workflow Process Manager, Business Service Method: RunProcess

Arguments to pass in: Business Service Context: "ProcessId", "1-3XTJ"

Configuration Details

Name: Workflow_1-3XTJ_Start
Sequence: 1
Active: ☒
Start Date:
End Date:
Action Type: BusService

Profile Attribute:
Set Operator:
Value:
Set Minimum:
Set Maximum:
Method Name:
Method Argument:

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Deploy and Activate the Workflow: Run-Time Events

The context of the Workflow Process Manager business service RunProcess method, shown in the lowest highlighted box, is a single name/value pair. The parameter name is ProcessName and its value, as shown above, is 1-3XTJ. This value is the Row Id of the workflow in the Workflow Deployment Definition table, S_WFA_DPLOY_DEF. This table holds definitions for all activated workflows. The action set, with these values, is created when you reload run-time events.

3. Reload the Run-Time Events

- Navigate to Administration - Runtime Events > Events
- Select Menu > Reload Runtime Events
 - Updates the run-time event engine with the new run-time event
 - Not necessary to query for the specific run-time event

The screenshot displays the Siebel 'Events' interface. On the left, a menu is open with 'Reload Runtime Events' highlighted by a red rectangle. The main area shows a table of runtime events. A yellow callout box points to the 'WriteRecord' event in the table, stating: 'Run-time event created by activating the workflow process'.

Sequence	Object Type	Object Name	Event	Subevent	Action Set Name
> -1	BusComp	Contact	WriteRecord		Workflow_1-3P52

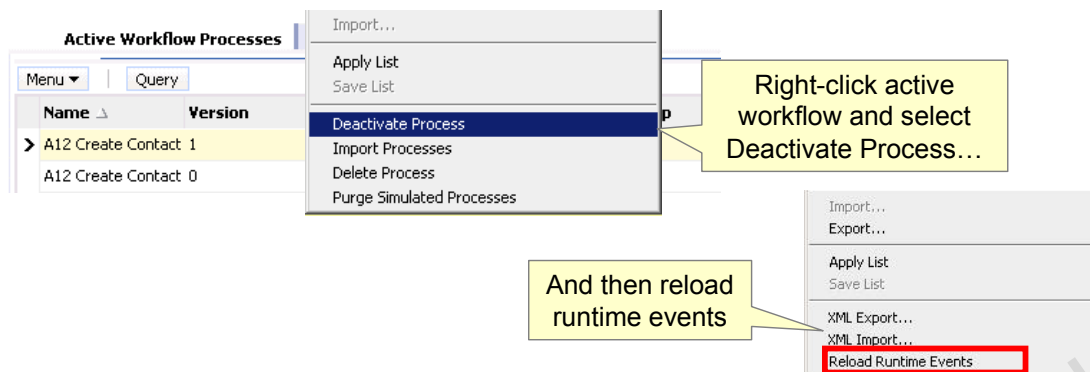

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Deactivating a Workflow Invoked by a Runtime Event

Recommended practice for deactivating a workflow process that is triggered by a runtime event:

1. Deactivate the workflow in the Workflow Deployment > Repository Workflow Processes view
2. Remove the event record if no other action sets are associated with it
3. Reload runtime events

ORACLE

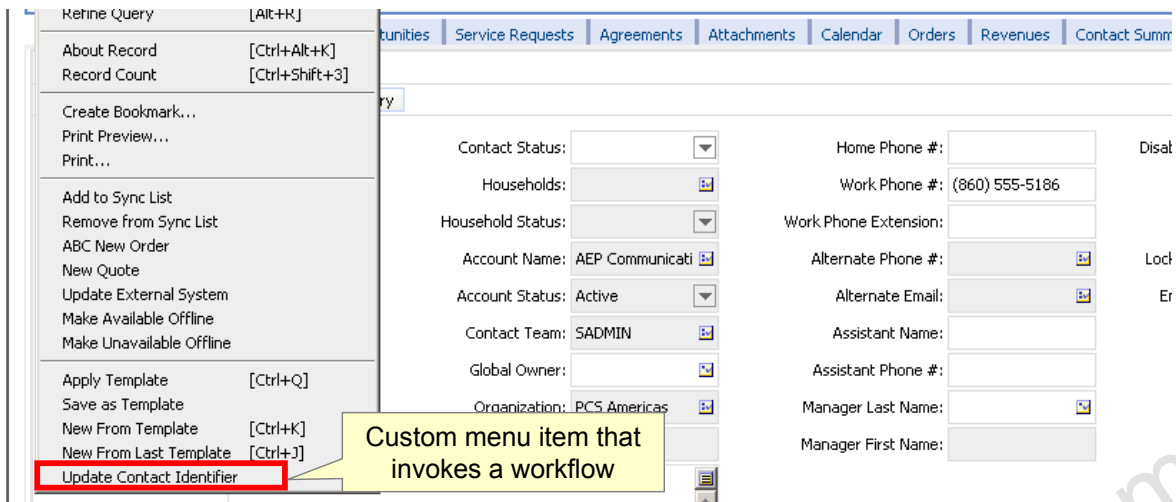

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Deactivating a Workflow Invoked by a Runtime Event

The diagram shows a workflow being deactivated in the Administration - Business Process > Workflow Deployment > Repository Workflow Processes view, and runtime events being reloaded in the Administration - Runtime Events > Events view.

Invoking Workflows Using a Custom Control

- User explicitly clicks a custom button or menu item to invoke the workflow
- Configuration involves applet user properties

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking a Workflow Using a Custom Menu Item

- Create a Command object
 - Specify a value for the Method property
- Add an Applet Method Menu Item to reference the Command

The screenshot displays three overlapping windows from the Siebel Business Automation interface:

- Commands**: A table with columns: W, Name, Change, Project, Target, Method, Business Service. A row is highlighted with a red box around the 'Update Customer Code' entry. The 'Method' column for this entry contains 'ABCWF'.
- Applet Method Menu Item List**: A window with tabs for 'Applet Method Menu Item List', 'Workflow Process - ABC Create Cont...', and 'Workflow Process - A12 Cre...'. It contains a table with columns: W, Name, Changed, Project, Business Component. A row is highlighted for 'Contact Form Applet' with 'Contact (SSE)' in the Project column and a link to 'Contact' in the Business Component column.
- Applet Method Menu Items**: A table with columns: Command, Changed, Menu Text, Menu Text - String Reference. A row is highlighted with a red box around the 'Update Customer Code' entry. The 'Menu Text' column for this entry contains 'Update Contact Identifier'.

A red arrow points from the 'Update Customer Code' entry in the 'Commands' table to the 'Update Customer Code' entry in the 'Applet Method Menu Items' table, illustrating the linkage between the two.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking a Workflow Using a Custom Menu Item

- Add a new Applet User Property that associates the workflow to be invoked with the new named method

The screenshot shows the Siebel Object Explorer on the left and two tables on the right. The 'Commands' table has a red box around the 'Method' column value 'ABCWF' for the 'Update Customer Code' command. The 'Applet User Properties' table has a red box around the 'Named Method: ABCWF' row. A red arrow points from the 'ABCWF' method in the 'Commands' table to the 'Named Method: ABCWF' row in the 'Applet User Properties' table. Below the tables are two yellow callout boxes with text.

W	Name	Change	Project	Target	Method
	Update Customer Code	✓	AAA Workflows	Server	ABCWF

W	Name	Change	Value
	DeDuplication Results Applet		DeDuplication Results (Contact) List Applet
	Named Method 1: SynchContact		'INVOKE', 'WriteRecord'
	Named Method 2: SynchContact		'INVOKE', 'EventMethodSynchronizeContact'
	Named Method: ABCWF	✓	'INVOKESVC', 'Workflow Process Manager', 'RunProcess', '"ProcessName"', '"A11 Update ContactCode"', '"RowId"', '[Id]'

Invoke this business service and method and ...

... pass in these pairs of argument names and values

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking a Workflow Using a Custom Button

- Create a custom Control for the button
 - Specify a value for the Method Invoked property
- Add a new Applet User Property that associates the workflow to be invoked with the new named method

The screenshot displays the Siebel Object Explorer on the left and the Controls table on the right. The Controls table has columns: Name, Caption, and Method Invoked. A row is highlighted with a red border, showing 'CreateActivity' as the Name, 'Create Activity' as the Caption, and 'NewActivity' as the Method Invoked. A yellow callout box points to the 'NewActivity' value with the text: 'Specify a user-defined name for a Method to invoke on the control'.

Below the Controls table, the Applet User Properties table is shown. It has columns: W, Name, and Value. A row is highlighted with a red border, showing 'Named Method: NewActivity' as the Name and a long string of workflow parameters as the Value. A yellow callout box points to the 'Named Method: NewActivity' value with the text: 'Create an applet user property specifying the workflow to execute when the named method is invoked'.

Name	Caption	Method Invoked
CreateActivity	Create Activity	NewActivity

W	Name	Value
	Named Method: NewActivity	'INVOKESVC', 'Workflow Process Manager', 'RunProcess', 'ProcessName', 'CreateActivity', 'RowId', 'Id'

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking a Workflow Process Programmatically

- The Workflow Process Manager business service can be invoked in a script
 - Use the InvokeMethod() method
 - Pass a workflow process name and Object Id as input arguments
- Script excerpt:

```
var oSvc : Service = TheApplication.GetService("Workflow Process Manager");
var inputPS : PropertySet = new PropertySet();
var outputPS : PropertySet = new PropertySet();

// Create input property set
inputPS.SetProperty("ProcessName", "AUT Example Workflow");
inputPS.SetProperty("RowId", "1-4ICW");

//Invoke workflow using InvokeMethod with RunProcess method
oSvc.InvokeMethod("RunProcess", inputPS, outputPS);

//....
```

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking a Workflow Process Programmatically

The script excerpt shown is in eScript, a scripting language similar to JavaScript used in Siebel server scripts. The syntax and methods used in this script are described in Bookshelf's *Siebel eScript Language Reference*.

Lesson Highlights

- A workflow process can be invoked by a variety of mechanisms:
 - Run-time events
 - Custom buttons and menu items
 - Workflow policies
 - In a script using a business service
- Run-time events are a mechanism that allows customer-configured processing to be triggered by user activity
- A workflow can be invoked using a custom menu item or a custom control, such as a button:
 - Use Siebel Tools to create required object definitions
- Invoke a workflow in a script by invoking the Workflow Process Manager business service's RunProcess method

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 6 Overview: Executing Workflow Processes

This practice covers the following topics:

- Configuring email in Siebel applications
- Invoking a workflow using a run-time event
- Using a communications template and sending email in a Siebel workflow
- Invoking a workflow from a custom menu item

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

7

Using Workflow Policies

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Create a workflow policy that invokes a workflow process in the Workflow Process Manager server component
- Enable the workflow policy using workflow server components

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Asynchronous Workflow Processing

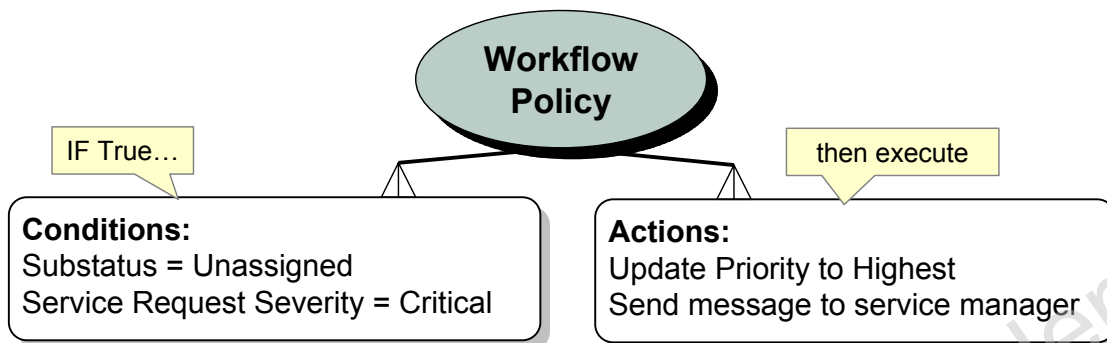

- Some workflows need to be executed asynchronously
 - They might run for a long time and should not execute in the user's object manager
 - They might need to wait for the invoking condition to be satisfied for some period of time
 - Example: If a service request of critical severity remains unassigned for more than two hours, notify the service manager and set SR priority to Highest
- Workflow policies are a mechanism for asynchronous execution of workflow processes

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Policies

- A workflow policy is a rule consisting of:
 - One or more policy conditions
 - A policy action
- The action is invoked when all conditions are true
- Example: When a service request Severity = Critical and Substatus = Unassigned:
 - Send an urgent message to the service manager

ORACLE

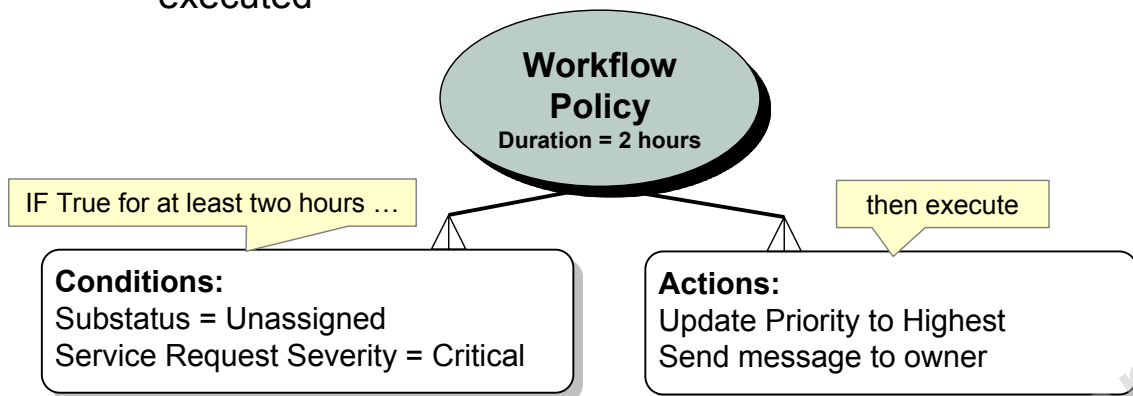

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Policies

Workflow policies are documented in Bookshelf's *Siebel Business Process Framework: Workflow Guide*, "Workflow Policies".

Workflow Policy Conditions

- A policy condition specifies a logical relationship between a workflow policy column and a value
- All policy conditions must be true for a condition to apply
- A policy may have a duration specified
 - Conditions must apply for the duration before the action is executed

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Policy Conditions

Workflow Policy Column

A workflow policy column is an object definition configured in Siebel Tools that identifies a column in a Siebel database table that can be monitored by a workflow policy. Configuring workflow policy columns is discussed later in this lesson.

Workflow Policy Actions

- A workflow policy action is the response to be executed
- Consists of:
 - Type of program to be executed
 - Examples: Run workflow process, send email, send message broadcast
 - One or more program-specific arguments
- Actions are defined separately
 - Can be used in multiple workflow policies

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Process Manager

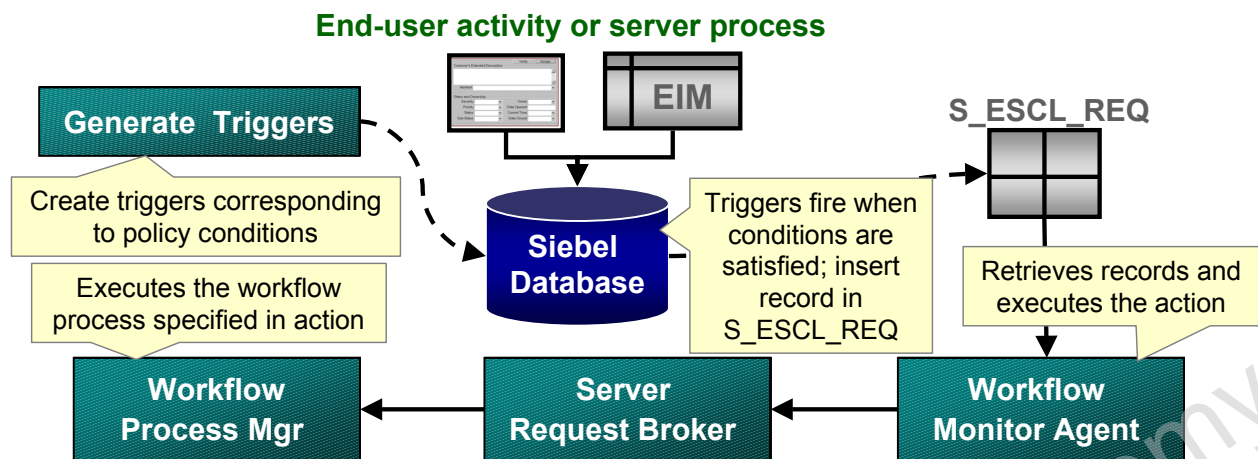

- Workflow policies use the Workflow Process Manager server component
- This component:
 - Is optimized for executing workflows
 - Behaves like an object manager
 - Can access the business and data layers
 - Does not have a user interface for direct user interaction
 - Uses database triggers:
 - A trigger is a process or a stored procedure attached to a database table that fires when a specified data modification event occurs
 - Are created by the Generate Triggers server component

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Executing Workflow Policies: Overview

- Generate Triggers creates the database triggers required to monitor conditions in policies
- Workflow Monitor Agent checks for fired triggers
- Workflow Process Manager executes the workflow process

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

ORACLE

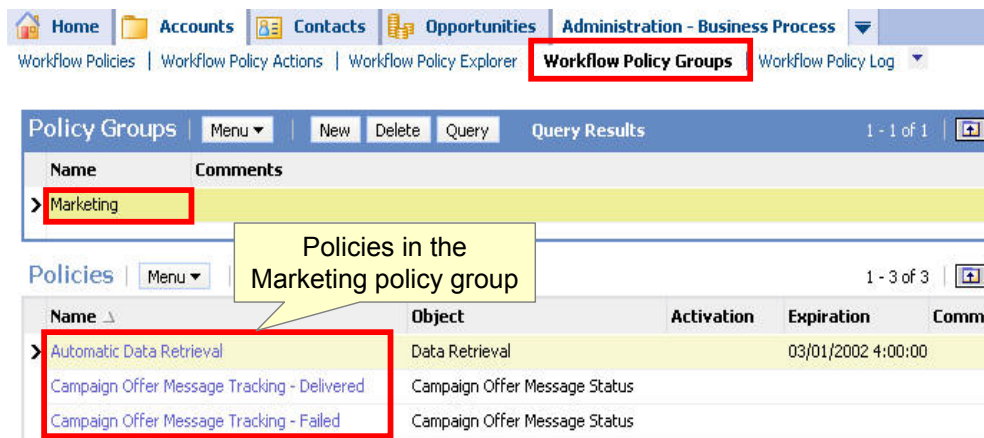

Executing Workflow Policies: Overview

After you create a workflow policy, specifying conditions and workflow policy actions, you will generate triggers and start a Workflow Monitor Agent. The workflow policy executes as follows:

- When the workflow policy conditions are met, triggers fire.
- These triggers insert a record in S_ESCL_REQ identifying the records that meet the workflow policy condition(s).
- The Workflow Monitor Agent server component runs, often after a specified sleep interval, and scans S_ESCL_REQ.
- If the Workflow Monitor Agent finds new records in S_ESCL_REQ created by policies in the agent's policy group, it executes the appropriate workflow policy action.
- If the action is to execute a workflow process, the Workflow Monitor Agent dispatches a request to the Workflow Process Manager server component by way of the Server Request Broker.
- The Workflow Process Manager server component executes the business service of the same name.

Workflow Policy Groups

- A workflow policy group is a collection of workflow policies that are monitored as a group by a Workflow Monitor Agent process
 - Typically workflow policies that can be monitored at the same frequency are assigned to the same policy group

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Policy Groups

Multiple Workflow Policy Groups

A workflow group can be made up of similar policies. This could mean all policies with a high frequency, or all policies dealing with integration, and so on. Alternatively, all policies could be bundled together. All the policies in a group are monitored concurrently.

Policies with similar time intervals are generally grouped together. By creating groups of policies with similar time intervals, you can assign the workflow policy group a Workflow Monitor Agent with a polling rate that matches the needs of the workflow policies. This results in a more efficient use of resources.

Multiple Workflow Monitor Agents

Each Workflow Monitor Agent is assigned one workflow policy group. The reasons to use multiple Workflow Policy Agents are:

- To shorten the time between when the policy event is triggered and when the Workflow Monitor Agent notices the event.
- To spread the workload across multiple application servers.
- To adjust the polling interval so that polling for non-critical policies does not prevent efficient processing of critical policies.

Implementing a Workflow Policy

The steps to implement a workflow policy are:

1. Create a Workflow Policy Group
2. Create a Workflow Policy Action
3. Create a Workflow Policy
4. Generate Database Triggers
5. Start the Workflow Monitor Agent

More

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Create a Workflow Policy Group

- Navigate to Administration - Business Process > Policy Groups
- Create a new policy group

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Create a Workflow Policy Action

- Navigate to Administration - Business Process > Actions
- Create a new action
 - Specify Run Workflow Process
- Provide workflow process as an argument

The screenshot shows two parts of the Oracle Siebel interface. The top part is the 'Actions' table, and the bottom part is the 'Arguments' table. A callout points to the 'Run Workflow Process' program in the Actions table, and another callout points to the 'Email Service Mgr' value in the Arguments table.

Name	Program	Workflow Object	Comments
> Notify Service Mgr	Run Workflow Process	Service Request	

Specify the Run Workflow Process program

Argument	Required	Value
> ProcessName		Email Service Mgr

Specify the workflow process to invoke

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Create a Workflow Policy Action

Workflow policy actions are events that occur when the conditions of their workflow policy are met. You must create the necessary workflow policy actions before creating the policy that will use the action. If the action calls a workflow process, the workflow must already be published and activated.

3. Create a Workflow Policy

- Navigate to Administration - Business Process > Workflow Policies
- Create a new policy
 - Specify conditions
 - Add one or more actions

Workflow Policies | Workflow Policy Actions | Workflow Policy Explorer | Workflow Policies

Policies List | Menu | New | Delete | Query | Policies List

Name	Workflow Object	Policy Group
Escalate Service Request Policy	Service Request	Hourly Service Request

Create a policy

Conditions | Menu | New | Delete | Query

Condition Field	Operation	Value
Service Request Status	=	Open

Create a condition

Actions | Menu | New | Delete | Query

Action	Sequence	Consolidate
Notify Service Mgr	1	

Associate an action that invokes the workflow process

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Create a Workflow Policy

For a policy, at least one condition must be defined, which causes an action to start a workflow process.

3. Create a Workflow Policy: Set Duration

- Set a duration for the workflow policy
 - All conditions must be met *and* the policy duration must be satisfied to trigger the workflow policy actions
 - Defaults to 0
 - The workflow policy actions are triggered as soon as the policy conditions are met

Workflow Policies | [Workflow Policy Actions](#) | [Workflow Policy Explorer](#) | [Workflow Policy Groups](#) | [Workflow P](#)

Policies List Menu ▾ New Delete Query Policies List ▾				
Name ▴	Workflow Object	Policy Group	Duration	Units
> Escalate Service Request Policy	Service Request	Hourly Service Request	1	Hour(s)

Conditions Menu ▾ New Delete Query		
Condition Field	Operation	Value
> Service Request Status	=	Open

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Create a Workflow Policy: Set Duration

A workflow policy defines a duration, even if it is zero, to fire triggers in the database. Once the policy conditions have been met, and the duration has been exceeded, then the action occurs.

4. Generate Database Triggers

- Run a Generate Triggers batch job to create database triggers corresponding to the policy conditions
 - When a trigger fires against a Policy Condition, a record is inserted in the Escalation Request Table (S_ESCL_REQ)
 - S_ESCL_REQ contains all the rows in the database that could trigger a policy to take action

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Generate Database Triggers

Triggers

Triggers monitor the database for records with conditions that match the policies.

Changing Triggers

Triggers are visible in the server database if you use database tools. Do not change these triggers using database tools: they should only be modified by running a Generate Triggers job.

4. Generate Database Triggers: Creating a Job

- Navigate to Administration - Server Management > Jobs
- Create a new job
 - Select component/job Generate Triggers
 - Specify job parameters
- Submit the job

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

ORACLE

4. Generate Database Triggers: Creating a Job

Privileged User

Credentials for a privileged user must be specified in order to allow the generation of triggers on the Siebel database tables. Most often the database owner for the Siebel database is specified.

Generate Triggers job parameters

The EXEC parameter must be set to TRUE for a Generate Triggers job so that the Generate Triggers component automatically creates the SQL script and applies it to the server database. You will do this during this lesson's practice.

Mode Job Parameter

Another job parameter for Generate Triggers is Mode (not shown above). By default, the Generate Triggers component will generate triggers for both Assignment Manager and Workflow (Mode = ALL). If you set Mode = WORK then just workflow triggers are generated. Mode = ASSGN will generate triggers for Assignment Manager only. Assignment Manager is covered later in this course.

Trigger SQL File

The SQL file generated is called trigger.sql and is located in the siebsrvr folder.

5. Start the Workflow Monitor Agent

- Create a custom Workflow Monitor Agent component definition to specify a Workflow group
 - Monitors all policies within a single Workflow group
- Activate the new component definition to make it available

The screenshot shows the Siebel Administration interface. The top navigation bar includes Home, Accounts, Contacts, Opportunities, Quotes, and Administration - Server Configuration. The main content area is titled 'Enterprise Servers' and shows a list of servers. The 'Component Definitions' tab is selected, displaying a table of component definitions. The 'Activate' button is highlighted in red. The table lists four components: Workflow Action Agent, Workflow Monitor Agent, Workflow Monitor Agent Hourly, and Workflow Process Batch Manager. The 'Workflow Monitor Agent Hourly' component is highlighted in yellow, and its 'State' is 'Creating'.

Component	Alias	Component Type	State	Component Group
Workflow Action Agent	WorkActn	Workflow Action Agent	Active	Workflow Management
Workflow Monitor Agent	WorkMon	Workflow Monitor Agent	Active	Workflow Management
Workflow Monitor Agent Hourly	WFM Hourly	Workflow Monitor Agent	Creating	Workflow Management
Workflow Process Batch Manager	WfProcBatchMgr	Business Service Manager	Active	Workflow Management

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

ORACLE

5. Start the Workflow Monitor Agent

Create a custom Workflow Monitor Agent (WMA) by copying the definition of the original WMA and modifying its parameters. One important component parameter to set is Group Name, which specifies which workflow policy group will be monitored.

Note you must restart the Siebel Server to make the new component definition available.

Verify the Workflow Policy

- Create a test record (or modify an existing record) that meets the policy condition
- Wait for at least the policy duration
- Verify that the desired workflow actions are executed

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Extending Workflow Policies: The Problem

- Workflow conditions are composed from a pre-configured set of business component fields
 - Conditions are composed in the Workflow Policies Conditions applet
- You may wish to create a workflow policy using a field that does not appear in the Condition Field drop down

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Extending Workflow Policies

Extending workflow policies is documented in Bookshelf's *Siebel Business Process Framework: Workflow Guide*, "Workflow Policies".

Extending Workflow Policies: Example

- You want to compose a workflow policy condition for a Contact using the contact's Account URL field

The screenshot shows two Siebel CRM windows. The top window, titled 'My Contacts', displays a list of contacts. The contact 'Kenner Fred' is selected, and the 'Account' field shows 'Acme Company'. A red box highlights 'Acme Company', and a yellow callout bubble labeled 'Contact Account' points to it. A red arrow points from this bubble to the 'Acme Company' account form below. The bottom window, titled 'Acme Company', shows the account details. The 'URL' field is highlighted with a red box, and a yellow callout bubble labeled 'Account URL' points to it. The URL value is 'www.acmeco.com'.

Last Name	First Name	Account	Work
Kenner	Fred	Acme Company	

Acme Company			
Menu New Delete Query			
Account Name:	Acme Company	Site:	Nashville HQ
Address:	123 Volunteer Pl.	State:	TN
City:	Nashville	Country:	USA
Zip Code:		Main Phone #:	
		Main Fax #:	
		URL:	www.acmeco.com

- Account URL does not appear in Condition Field drop down

The screenshot shows the 'Conditions' window in Siebel CRM. The 'Condition Field' drop-down menu is open, showing a list of available fields. The 'Account URL' field is not visible in the list. A yellow callout bubble labeled 'Account URL is not available' points to the drop-down menu.

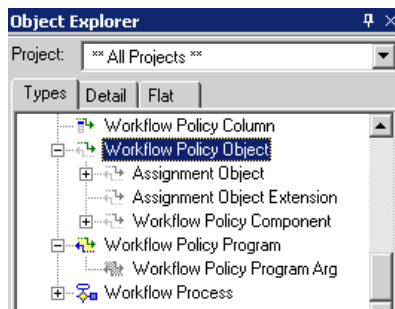

Condition Field	Operation	Value
>		
Account Site		
Account Status		
Account Type		
Brick Name		
City		
Contact Address Last Update Date		

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Extending Workflow Policies: The Solution

- Use Siebel Tools to extend the pre-defined set of workflow policy objects
- Extend workflow policy functionality by extending the hierarchy of workflow policy object definitions:
 - Can make new Condition Fields available in the Workflow Policy Conditions applet
 - Can make new Actions available in the Workflow Policy Actions applet

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Extending Workflow Policies: The Solution

Viewing Workflow Policy Object Types in Siebel Tools

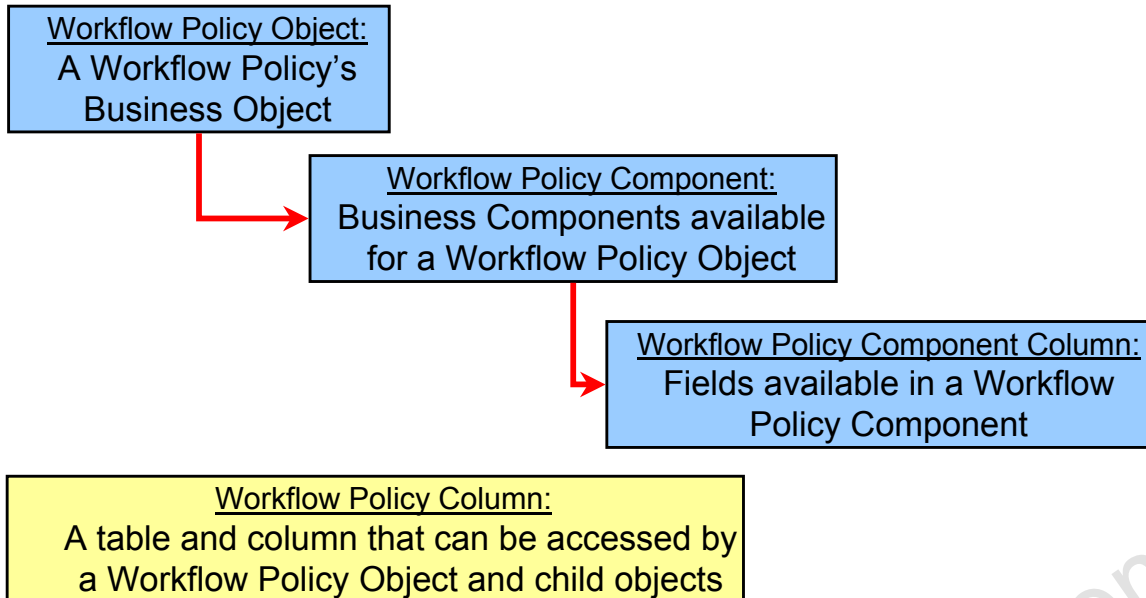

Use View > Options > Object Explorer to make workflow policy object types visible in the Siebel Tools Object Explorer. These object types are not shown by default.

Other Extensions

This section focuses on adding new Condition Fields to the Workflow Policy Conditions applet. Refer to Bookshelf's *Siebel Business Process Framework: Workflow Guide* for details on how to make new Actions available in the Workflow Policy Actions applet.

Workflow Policy Object Types

Object types used to expose new workflow policy condition fields are:

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

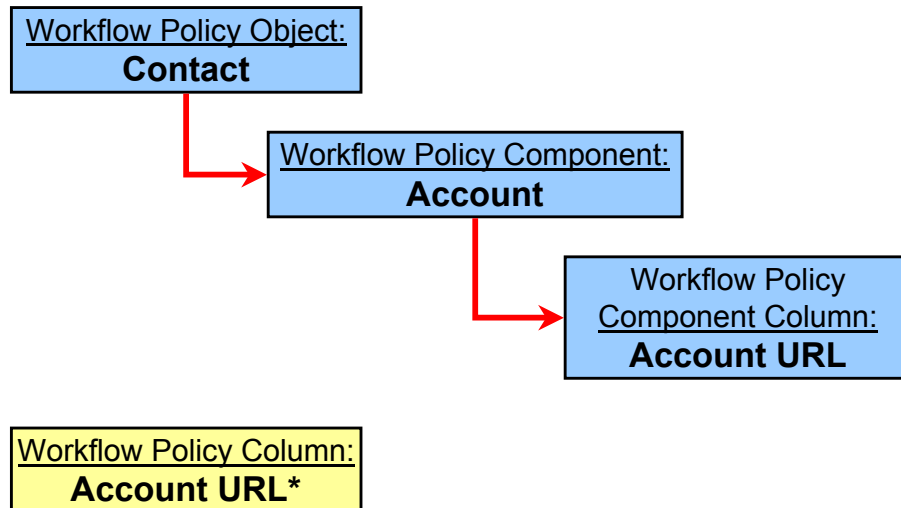

Workflow Policy Object Types

The types shown above are:

- Workflow Policy Object: corresponds to a policy's Workflow Object value
- Workflow Policy Component: specifies the BCs that can be accessed through a Workflow Policy Object
- Workflow Policy Component Column: specifies the fields available in a Workflow Policy Component
- Workflow Policy Column: specifies a table and column that can be accessed by a Workflow Policy Object and child objects

Workflow Policy Object Types Example

To have a Contact's Account URL available in workflow policy conditions, the following objects must be defined:

*Specifies Account URL table and column (S_ORG_EXT and URL)

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Workflow Policy Object Types Example

One way to remember the workflow policy object types is to view the Workflow Policy Object hierarchy of types as analogous to Business Object > Business Component > BC Field. This hierarchy is in the business layer. The Workflow Policy Column object maps the business layer to the data layer by mapping a Workflow Policy Component Column to a database table and column.

Adding a New Policy Condition Field

To make a new column available in workflow policy conditions:

1. Identify the field's database table and column
2. Create a Workflow Policy Column definition
3. Create a Workflow Policy Component Column definition
4. Compile and test

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Adding a New Policy Condition Field

The example given here and on the following slides is relatively modest: expose a new column in an existing Workflow Policy Component. Account is already defined as a child Workflow Policy Component of the Contact Workflow Policy Object, so only new Workflow Policy Column and Workflow Policy Component Column definitions need to be created. Creating new Policy Components and Policy Objects requires a detailed knowledge of the underlying data model, specifically determining the primary/foreign key relationships between Siebel tables. This information can be found in Siebel Tools.

Details on defining new Policy Objects and Policy Components is found in the *Siebel Business Process Framework: Workflow Guide*, “Workflow Policies”.

1. Identify the Field's Database Table and Column

- Use Siebel Tools to map a user interface (UI) control or business component field to a table and column
 - Examine UI object, such as an Applet, to map a control to a BC field
 - Examine a BC field definition to map to a table and column

The diagram illustrates the process of mapping a Siebel UI control to a database table and column. It consists of three main parts:

- Business Component and Account:** A red box highlights the 'Business Component' and 'Account' fields in the Siebel Tools interface. A yellow callout bubble points to this box with the text 'BC for applet'.
- UI Control:** A screenshot of the 'Acme Company' applet is shown. A red box highlights the 'URL: www.acmeco.com' field. A yellow callout bubble points to this box with the text 'BC field for UI control'.
- Table and Column:** A table with columns 'W', 'Name', 'Join', and 'Column' is shown. A red box highlights the row with 'Name' 'Home Page', 'Join' 'S_ORG_EXT', and 'Column' 'URL'. A yellow callout bubble points to this row with the text 'Table and Column for BC field'.

The mapping is as follows:

W	Name	Join	Column
	Home Page	S_ORG_EXT	URL

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Create a Workflow Policy Column Definition

- Create a new Workflow Policy Column definition, specifying:
 - Name
 - Project
 - Table name
 - Column
- Allows column to be used in a Workflow Policy Component Column definition

Workflow Policy Columns					
	W	Name	Project	Table Name	Column Name
>		Account URL	Assignment (SSE)	S_ORG_EXT	URL

Table and Column
for BC field

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Create a Workflow Policy Component Column Definition

- Create a new Workflow Policy Component Column definition for the appropriate Workflow Policy Object and Workflow Policy Component, specifying:
 - Workflow Policy Column name

Workflow Policy Component Columns		
	Workflow Column Name	Alias
> 	Account URL	Account URL

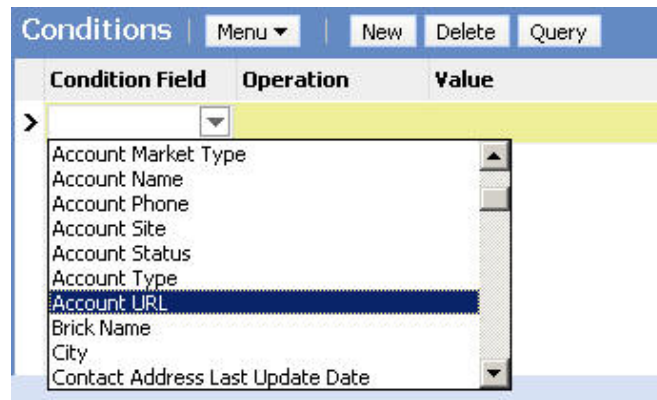

Use dropdown to select the name of the Workflow Policy Column created in the previous step

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Compile and Test Changes

- Compile projects for all modified and new object definitions
- Check in changes to the server
- Verify that the field is available in the Workflow Policy Conditions applet

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Lesson Highlights

- A workflow policy is a rule consisting of one or more conditions and a policy action to be executed when the conditions are satisfied
- Workflow policies implement asynchronous execution of workflow processes
- Workflow policies require the use of:
 - Generate Triggers to create the database triggers
 - Workflow Monitor Agent to check for fired triggers
 - Workflow Process Manager to execute the associated workflow policy
- Create Workflow Policy object definitions to expose more database columns for use in workflow policy conditions

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 7 Overview: Using Workflow Policies

This practice covers the following topics:

- Configuring a new workflow policy column
- Creating a workflow policy
- Administering workflow components
- Invoking workflow with a workflow policy

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

8

Configuring the Universal Inbox

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Describe the Universal Inbox
- Describe the underlying Universal Inbox architecture
- Configure the Universal Inbox

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

The Universal Inbox

- Is a single screen designed to show all approval and notification items to a user
- Handles many different types of items
 - For example, service requests, paused tasks, quotes, orders, or agreements awaiting approval, and so forth
- Is available from **Inbox > Inbox Items List > My Inbox Items**

Completed	Category	Name	From	Action	Priority	Received
		Assets to Agreeemen	Casey Cheng			2/13/2009 11:10:15 AM
>		410194-13387215	Casey Cheng			2/6/2009 8:44:39 AM
		176914-5093941	Casey Cheng	Open		4/7/2005 3:41:25 AM
		176914-4935125	Casey Cheng			3/31/2005 2:39:15 AM

A user's Inbox may show service requests, paused tasks, and other items requiring the user's attention

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

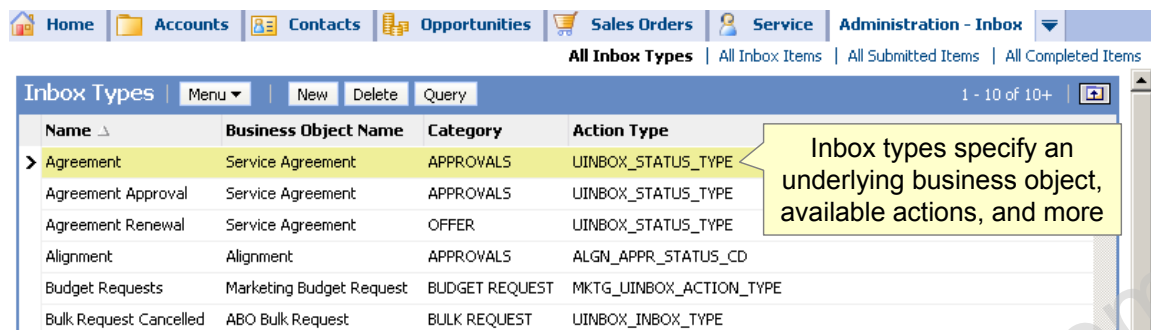

The Universal Inbox

Reference: “Administering and Using Inbox” in the *Siebel Applications Administration Guide* on Oracle Technology Network.

My Team's Inbox Items: Similar to other views managed by Access Control, managers should have access to the “My Team's Inbox Items” view, which shows all of the Inbox items of all of their reports.

Inbox Types

- Determine the behavior of Inbox items of that type:
 - The destination view when the user drills down on the Inbox item name
 - Available actions for that Inbox item
 - Whether the Inbox item is transferable
 - Expiration time for that Inbox item
 - And so forth

Inbox Types | Menu | New | Delete | Query | 1 - 10 of 10+ | [Icon]

Name	Business Object Name	Category	Action Type
> Agreement	Service Agreement	APPROVALS	UINBOX_STATUS_TYPE
Agreement Approval	Service Agreement	APPROVALS	UINBOX_STATUS_TYPE
Agreement Renewal	Service Agreement	OFFER	UINBOX_STATUS_TYPE
Alignment	Alignment	APPROVALS	ALGN_APPR_STATUS_CD
Budget Requests	Marketing Budget Request	BUDGET REQUEST	MKTG_UINBOX_ACTION_TYPE
Bulk Request Cancelled	ABO Bulk Request	BULK REQUEST	UINBOX_INBOX_TYPE

Inbox types specify an underlying business object, available actions, and more

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Inbox Types

Configuring Inbox Types: Details of configuring Inbox types are covered later in this lesson.

Inbox: User Activities

- Users take actions on Inbox items depending on the Inbox type

The screenshot shows the Siebel Inbox interface. At the top, there are tabs for Home, Accounts, Orders, Service, Communications, and Inbox. Below these are links for Inbox Items List, Completed Items List, and Submitted Items List. The main area displays a table of inbox items. A callout points to the 'Delete Task' and 'Transfer' buttons, stating 'Delete or Transfer an item (Availability depends on Inbox type)'. Another callout points to the 'Priority' column, stating 'Set a priority'. A third callout points to the 'Action' column, stating 'Perform an action (list depends on Inbox type)'. A fourth callout points to the 'Name' column, stating 'Drill down on the item name for more information'. A fifth callout points to the 'More Info', 'Detail', and 'History' tabs, stating 'Examine the Inbox history or detail of the item'. The table contains the following data:

Completed	Category	Name	From	Action	Priority	Received
		Assets to Agreement	Casey Cheng			2/13/2009 11:10:15 AM
>		410194-13387215	Casey Cheng		High	2/6/2009 8:44:39 AM
		176914-5093941	Casey Cheng			2005 3:41:25 AM
		176914-4935125	Casey Cheng			2005 2:39:15 AM

The 'Action' dropdown menu is open, showing options: Open, Pending, Closed, Cancelled, Exception Handling, Quoted, In Progress, Completed, Submitted, and Approved. The 'More Info' section below the table shows details for the selected item: Name: 410194-13387215, Action: (dropdown), Owner's Comments: (text area), From: Casey Cheng, Received: 2/6/2009 8:44:39 AM.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Inbox: Additional User Views

- The Completed Items List and Submitted Items List show submitted and completed items, respectively
 - The Inbox item type and action taken determine whether an item is marked as completed
 - For example, marking a service request as “Closed” should also make it “Completed”
- Submitted or Completed items cannot be updated by the user

Inbox: Additional User Views

Marking an Inbox item Submitted or Completed: Details on marking an Inbox item submitted or completed are provided later in this lesson.

Inbox: Administrative Views

- Application administrators use the Administration - Inbox screen to perform additional basic administration
 - Examine all active, submitted, or completed Inbox items
 - Administer Inbox types
 - Delete submitted items

Administrators may delete or transfer Inbox items, if that functionality is available for that item type

The Administration - Inbox screen looks similar to the Inbox screen, with the exception of the All Inbox Types view link

Completed	Category	Name	From	Action	Priority	Rec
	MARKETING PLAN	Millennium Yearly Marketing Plan 2004	Gregory Rogers	Not Yet Reviewed	High	
	MARKETING PLAN	DTY Corporate Wide Test Plan	Siebel Administrator	Not Yet Reviewed	High	

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Inbox: Object Types

- Two object types are shown in the various Inbox views:
 - Inbox Items are the base object type, and are shown in the Submitted Items List
 - Every time an Inbox record is created or modified, it appears in this list
 - Every Inbox Item includes a table of name-value pairs to store user parameters, if desired
 - Inbox Item Owners are child objects of Inbox Items, and represent the current state of the Inbox Item
 - An Inbox Item may have multiple Inbox Item Owners
 - Inbox Item Owners appear as records in the Inbox Items and Completed Items lists
- Administrators have the ability to delete Submitted Items
 - Removes the Inbox Item and all its child Inbox Item Owners

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Example: Creating Object Types

- Example: A user creates a service request, and a runtime event assigns that service request to a technical support engineer
 - The runtime event calls a business service, which creates an Inbox Item for the service request
 - This appears in the technical support engineer's Submitted Items list
 - This business service also creates two Inbox Item Owners for this Inbox Item
 - One for the technical support engineer, which appears in the technical support engineer's Inbox Items list
 - One for the technical support engineer's manager, which appears in the manager's Inbox Items list

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Example: Modifying Object Types

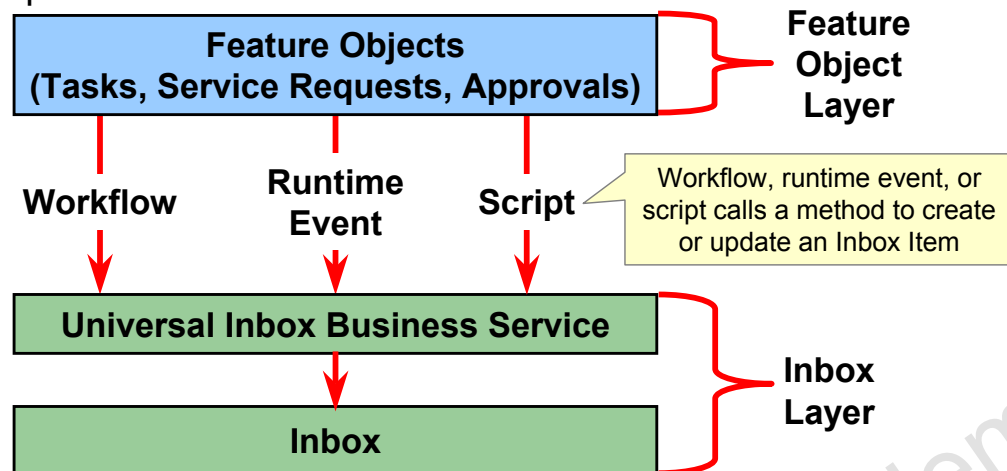

- Example: The technical support engineer resolves the issue and marks the service request Closed
 - The Inbox Item's status is updated
 - The Inbox Item Owners are deactivated, which marks them as "Completed" and moves them to the Completed Items List

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Inbox: Inbound Architecture

- To add items to the Inbox, a workflow, runtime event, or a script calls methods of the Universal Inbox Business Service
 - Also used to modify Inbox items if the feature object is updated

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Universal Inbox Business Service Methods

- The Universal Inbox Business Service has methods to:
 - Create, delete, update, or locate Inbox Items
 - Modify Inbox Item Owners
 - Invoke an Inbox action
 - Check to see whether an Inbox item already exists for an object
 - And more
 - See notes for a complete list

W/	Name	Changed	Project	Cache	CL
>	Universal Inbox		Universal Inbox	✓	CS

Business Service Methods				
W/	Name	Changed	Display Name	
>	CallAction		Call Action	
	CreateInbox		Create Inbox	

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Universal Inbox Business Service Methods

The methods available in the Universal Inbox Business Service are:

- **CallAction:** Invoke an Inbox Item's action, as defined by the Inbox type.
- **CreateInbox:** Create one or more Inbox Items and Inbox Item Owners.
- **CreateInboxEx:** Create a single Inbox Item and Inbox Item Owner.
- **CreateInboxItem:** Create one or more Inbox Items with no owners. These only appear in the Submitted Items list.
- **CreateInboxOwner:** Create one or more Inbox Item Owners for an Inbox Item.
- **DeactivateInboxItem:** Deactivates all Inbox Item Owners for an Inbox Item (makes them read-only) and marks them "Completed".
- **DeactivateInboxOwner:** Deactivates a specific Inbox Item Owner for an Inbox Item and marks it "Submitted".
- **DeleteInboxItem:** Delete an Inbox Item and all associated Inbox Item Owners.
- **GetInboxItemInfo:** Returns field values from an Inbox Item, and, optionally, the name-value pairs of the user parameters.
- **GetInboxOwnerInfo:** Returns field values for multiple Inbox Item Owners for a specified Inbox Item, and their action status.

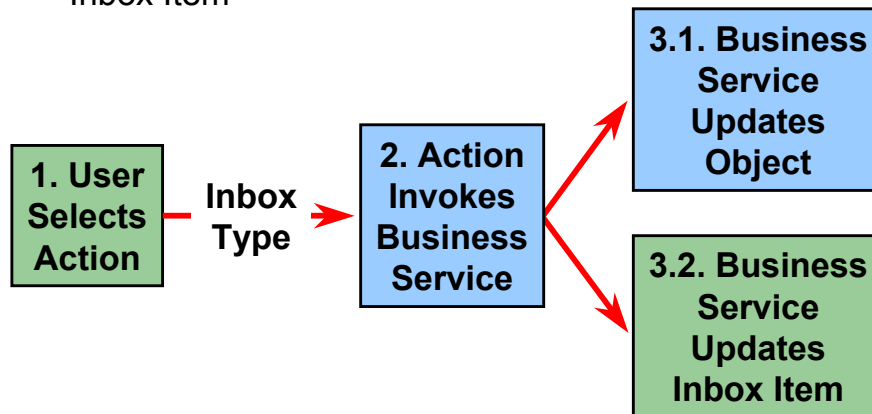

Universal Inbox Business Service Methods (continued)

- **GetInboxOwnerInfoEx:** Returns field values for a single Inbox Item Owner.
- **GetInboxParamInfo:** Returns name-value pairs of user parameters for an Inbox Item.
- **Initialize:** Obsolete. Included for backward compatibility.
- **IsInboxItemExisted:** Returns 1 if an Inbox Item exists, 0 otherwise.
- **RouteInboxItem:** Obsolete. Included for backward compatibility.
- **SetInboxParamInfo:** Set name-value pairs of user parameters for an Inbox Item.
- **UpdateInboxItemInfo:** Update field values for an Inbox Item.
- **UpdateInboxOwnerInfo:** Update field values for an Inbox Item Owner.

Oracle Internal & Oracle Academy
Use Only

Inbox: Outbound Architecture

- To move items from the Inbox:
 - An Inbox action invokes a workflow or a business service
 - This workflow or business service:
 - Updates the feature object
 - Uses a Universal Inbox Business Service method to update the Inbox Item

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Configuring the Inbox

To configure the Inbox to support your item:

1. Design the Inbox process flow
2. Create the Inbox type
 1. Specify the name and translations
 2. Specify the business object and destination view(s)
 3. Specify the Action Type
 4. Specify the Action(s)
 5. Specify the Queue and Expiration durations
 6. Specify the category, replication level, and other options
3. Create a workflow to add items to the Inbox
4. Create a workflow to process Inbox actions
5. Test the Inbox

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Design the Inbox Process Flow

- Determine:
 - On what business object will the Inbox item be based?
 - For example, Service Agreements
 - How will items be added to the Inbox?
 - For example, a runtime event invoking a workflow or Assignment Manager
 - To whose Inbox will the items be added?
 - Only one user or to their manager as well?
 - What actions are available on the Inbox item?
 - When is that Inbox item considered “complete”?

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2.1. Specify the Name and Translations

- Specify a name for the Inbox type
 - Used in Administration - Inbox > All Inbox Types view
- Specify language-specific translations
 - Used in More Info applets of Inbox views

The screenshot displays the Siebel Administration - Inbox interface. The top navigation bar includes links for Home, Accounts, Contacts, Opportunities, Sales Orders, Service, and Administration - Inbox. Below the navigation bar, there are tabs for All Inbox Types, All Inbox Items, All Submitted Items, and All Completed Items. The main content area is divided into two sections: 'Inbox Types' and 'Translations'.

Inbox Types

Name	Business Object Name	Category	Action Type
> Agreement	Service Agreement	APPROVALS	UINBOX_STATUS_TYPE
Agreement Approva	Service Agreement	APPROVALS	UINBOX_STATUS_TYPE
Agreement Renewal	Service Agreement	OFFER	UINBOX_STATUS_TYPE

Translations

Language	Display Name
> English-American	Agreement

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2.2. Specify the Business Object and Destination View(s)

- To specify the destination view when a user drills down on an Inbox item:
 - Specify a business object (BO) for the Inbox type
 - All destination views must be associated with this BO
 - Specify one or more views and sequence numbers
 - The user is navigated to the lowest sequence view to which they have access
 - Optionally, specify a SmartScript to be invoked
 - Invoked within the context of the specified view

The screenshot displays the Siebel configuration interface for 'Inbox Types'. The top section, titled 'Inbox Types', includes a menu bar with 'Menu', 'New', 'Delete', and 'Query' buttons, and a status bar showing '1 - 1 of 1'. Below this is a table with columns 'Name' and 'Business Object Name'. The 'Name' column has a value 'Agreement', and the 'Business Object Name' column has a value 'Service Agreement'. A yellow callout box points to the 'Business Object Name' column with the text 'Destination views must be based on this business object'. Below the table is a section titled 'Views' with a menu bar and a status bar. It contains a table with columns 'View', 'Sequence #', and 'SmartScript'. The 'View' column has a value 'FS Agreement Line Items View', the 'Sequence #' column has a value '2', and the 'SmartScript' column is empty. A yellow callout box points to the 'Sequence #' column with the text 'Specify at least one destination view'.

Name	Business Object Name
> Agreement	Service Agreement

View	Sequence #	SmartScript
> FS Agreement Line Items View	2	

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2.3. Specify the Action Type

- Specify an LOV type to use for the available list of actions
 - Selected action is passed as a parameter to the workflow or business service invoked when the action is selected

The screenshot illustrates the process of specifying an action type for an inbox item in Siebel CRM. It consists of three main panels:

- Inbox Types Panel:** A table listing inbox types. The first row is highlighted, showing 'Agreement' as the Name, 'Service Agreement' as the Business Object Name, 'APPROVALS' as the Category, and 'UINBOX_STATUS_TYPE' as the Action Type. A callout box points to the 'UINBOX_STATUS_TYPE' value, stating 'LOV Type is UINBOX_STATUS_TYPE'.
- List of Values Panel:** A table showing the definition of the 'UINBOX_STATUS_TYPE' LOV. It has columns for Type, Display Value, Language-Independent Value, Language Name, Parent LIC, and Order. The first three rows are highlighted, showing 'UINBOX_STATUS_TYPE' with 'Approved', 'Received', and 'Rejected' as display values.
- Inbox Items Panel:** A table listing inbox items. The first row is highlighted, showing 'AGF Master Agreement' as the Name, 'Siebel Administrator' as the From, and a dropdown menu for the Action. A callout box points to the dropdown menu, stating 'Available actions on Inbox item of that type'. The dropdown menu is open, showing the options 'Approved', 'Received', and 'Rejected'.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2.4. Specify the Action

- When a user selects an Inbox action, that action invokes a specified business service
 - Frequently the Workflow Process Manager business service to invoke a specified workflow
 - Specify the business service, method, and arguments

The screenshot shows the Siebel Administration - Inbox interface. At the top, there is a navigation bar with tabs: Home, Accounts, Contacts, Opportunities, Sales Orders, Service, and Administration - Inbox. Below the navigation bar, there are links: All Inbox Types, All Inbox Items, All Submitted Items, and All Completed I. The main content area is titled 'Inbox Types' and contains a table with columns: Name, Business Object Name, Category, and Action Type. The table has one row: Agreement, Service Agreement, APPROVALS, and UINBOX_STATUS_TYPE. Below the table, there are tabs: More Info, Translations, Views, and Actions. The Actions tab is selected, showing a table with columns: Action, Business Service, Business Service Method, Business Service Method Arguments, and Deact. The table has one row: Action Field Dropdown, Workflow Process Manager, RunProcess, "ProcessName", "Inbox - Agreement Action", and Deact. Three callout boxes are present: 'When an action is selected...' points to the Action field, '...invoke a workflow...' points to the Business Service field, and '...with these arguments' points to the Business Service Method Arguments field.

Name	Business Object Name	Category	Action Type
> Agreement	Service Agreement	APPROVALS	UINBOX_STATUS_TYPE

Action	Business Service	Business Service Method	Business Service Method Arguments	Deact
> Action Field Dropdown	Workflow Process Manager	RunProcess	"ProcessName", "Inbox - Agreement Action"	

When an action is selected...

...invoke a workflow...

...with these arguments

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2.4. Specify the Action

Business Service Method Arguments: In addition to the arguments you specify in the Business Service Method Arguments field, several arguments are passed to the business service, including Action LIC, the language-independent code for the action the user selects. The business service (or workflow) is then responsible for branching based on that action; for example, marking a service request as Closed should mark the Inbox Item as complete, while marking it as Pending should leave it in the user's Inbox. For a complete list of the arguments passed to the action business service, see "Setting Up Inbox Actions" in the *Siebel Applications Administration Guide* on Oracle Technology Network.

2.5. Specify the Queue and Expiration Durations

- The Default Queue Duration determines a due date for an item
 - If the Queue Duration expires without an action, the item is marked “Past Due”
 - No other action is taken
 - For example, to make a “Past Due” event send an e-mail to the Inbox Item Owner’s manager, you must configure that event
- The Item Expiration Duration determines an expiration date for an item
 - The expiration date is shown in the Submitted Items view
 - By default, no action is taken when an item expires

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2.6. Specify the Category, Replication Level, and Other Options

- The Category determines the icon shown next to the Inbox item
 - For new icons, use Siebel Tools to create a new bitmap record for the Bitmap Category :: Inbox Category
 - If no bitmap is specified, the text appears instead
- The Replication Level determines whether the Inbox items are copied to the local database:
 - None: Inbox Items of that type are only available in the master server database
 - Regional: Inbox Items of that type are available in the master server database, and regional databases
 - All: Inbox Items of that type are also available in local databases

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2.6. Specify the Category, Replication Level, and Other Options

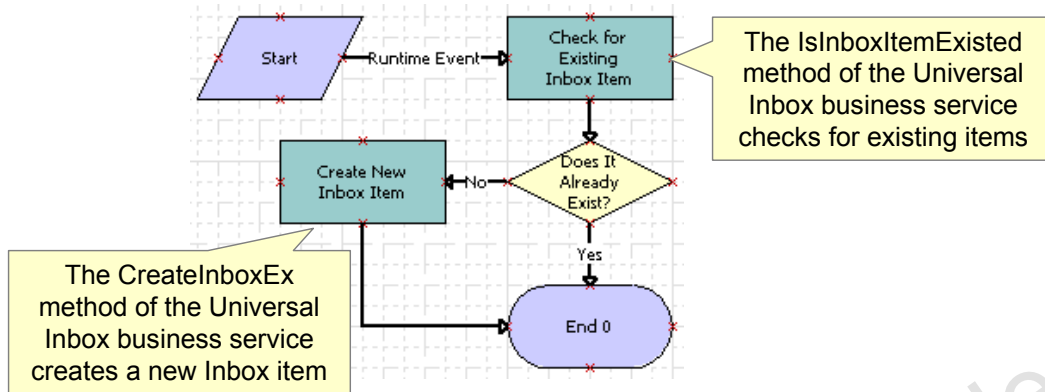

- The Transferable checkbox allows users to transfer Inbox items to a different user

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Create a Workflow to Add Items to the Inbox

- Could also use scripts or runtime events
- Configure enough process properties to invoke the Universal Inbox methods
 - For example: Inbox type, Inbox item recipient, recipient's manager, item owner, item Id, and so forth
 - Check each method's object definition to find its arguments

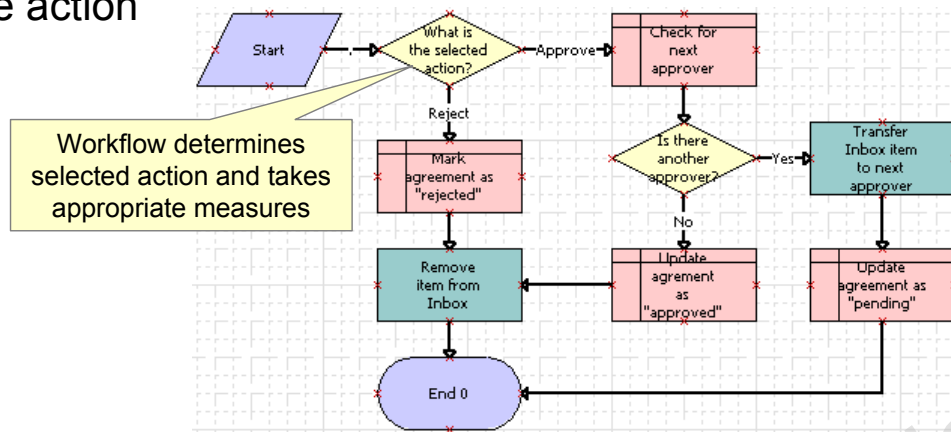

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Create the Workflow to Process Inbox Actions

- When a user selects an action, it invokes a business service
 - Typically the RunProcess method of the Workflow Process Manager business service
- This business service or workflow must correctly handle the action

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

5. Test the Inbox

- Test all possible permutations
 - Test all possible user actions
 - Test all possible manager actions
 - Test all possible administrator actions
- Intentionally try to cause exceptions
 - Submit items with empty fields
 - Submit items with invalid values in the fields

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Lesson Highlights

- Users use the Inbox to view their notification and approval items
 - They may take actions on Inbox items
- Configure the Inbox by:
 - Creating an Inbox type
 - Creating a workflow to populate the Inbox
 - Creating a workflow to process Inbox actions

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 8 Overview: Configuring the Inbox

This practice covers the following topics:

- Populating the Inbox
- Performing actions from within the Inbox

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

9

Using Siebel Data Validation Manager

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Describe the features of Siebel Data Validation Manager (DVM)
- Create and administer data validation rules
- Invoke DVM from a workflow process

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Data Validation Challenge

- Companies often place requirements on customer data to enforce business processes
 - Examples:
 - Any Quote with a discount more than 10% from the price list must specify an approving manager and a justification
 - A service request must have a customer callback number
 - An Opportunity must have a sales stage
- Validation requirements may be complex:
 - The validity of a record may depend on one or more field values
 - Validation requirements may change quickly
 - Data validation may need to be monitored to gauge employee familiarity and compliance with business processes

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Data Validation Solutions in Siebel Applications

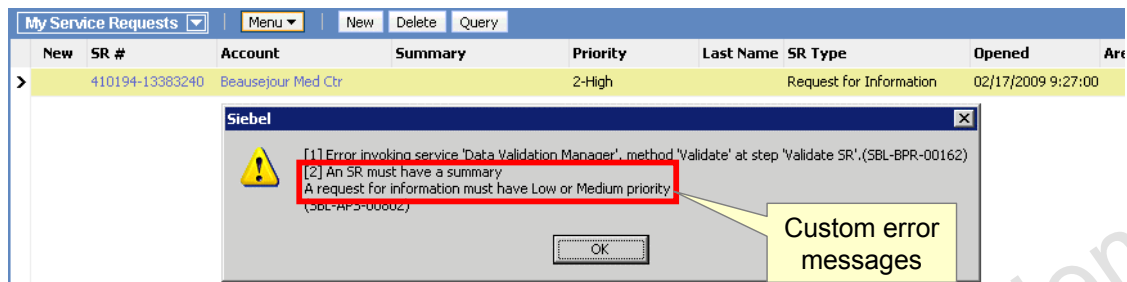

- Siebel applications support data validation with:
 - Application configuration using business component field properties:
 - Validation: specify field validation rules
 - Validation Message: a string that can be displayed for invalid field values
 - Siebel Data Validation Manager (DVM)
 - The subject of this lesson

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Siebel Data Validation Manager (DVM)

- Comprises the Data Validation Manager business service and a screen for administering validation rules and messages
- Allows:
 - Defining validation rules in an administration view
 - Building complex rules using Siebel Query Language
 - Displaying custom error messages
 - Logging validation events

ORACLE

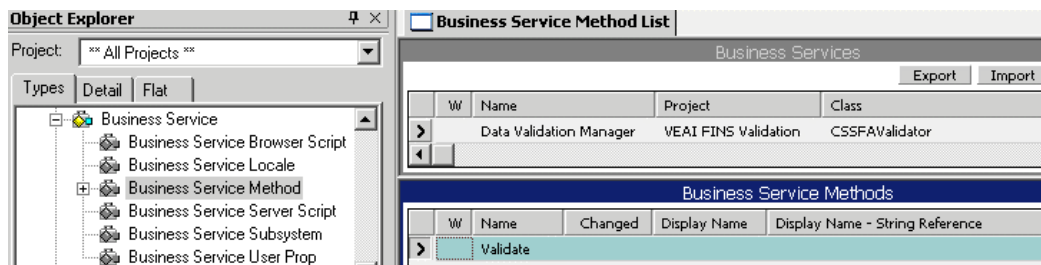

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Reference

Data Validation Manager is discussed in Bookshelf's Siebel *Order Management Infrastructure Guide*, "Data Validation Manager".

Data Validation Manager Business Service

- DVM is a business service that has a single method, Validate
 - Invoke the DVM business service in a workflow, Siebel task, or in an runtime event action set
- The Validate method uses validation data, created in the Siebel client, to check the validity of a specified business object

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

DVM Administrative Data: Overview

- Validation data used by DVM:
 - A validation rule set is one or more rules which operate on a specified business object and business component
 - Rules are written in Siebel Query Language and are evaluated on invocation of the rule set
 - Actions may be invoked when a rule evaluates to FALSE
 - FALSE indicates that a validation error has occurred
 - Rule set arguments are predefined arguments which may be used in a rule definition

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

DVM Administrative Data: Overview

Siebel Query Language is the language used to create search specifications and other similar expressions in Siebel Tools and the Siebel client. The syntax of this language, as well as descriptions of its operators and functions, is discussed in Bookshelf's *Siebel Personalization Administration Guide*, Appendices A and B.

DVM Execution

Define Data Validation Rules in Admin View

Created during application configuration

Application Invokes DVM

Runtime events, workflow, custom control, or script

DVM Business Service Evaluates Validation Rules

DVM Business Service

DVM Execution

Invoking the DVM business service is discussed in more detail later in this lesson.

Creating Validation Administrative Data

To create validation rules:

1. Create a Data Validation Rule Set
2. Set Rule Set Options
3. Create Data Validation Messages
4. Add Data Validation Rules
5. Associate Validation Messages with Rules
6. Add Actions to Rules
7. Specify Rule Detail
8. Activate the Rule Set

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Create a Data Validation Rule Set

- Navigate to Administration – Data Validation > Rule Sets
- Specify:
 - Rule set name
 - Business object and business component to be validated

Navigation: Home | Accounts | Contacts | Opportunities | Sales Orders | Service | Quotes | Administration - Data Validation

Validation Messages | Rule Sets | Validation

Name	Business Object	Business Component	Version	Status	View	Conditional Express
> AUT Service Request Validation	Service Request	Service Request	0	In Progress		

Callouts:

- Specify business object and business component
- Rule sets are versioned
- In Progress during creation

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Set Rule Set Options

- Use the detail applet to set rule set options:
 - Start and End Date: activate and deactivate rule set by date
 - View: restrict validation to data entered in a specific view
 - Conditional Expression: allows multiple rule sets per business component
 - Example: different validation rule sets for service requests with different areas or products

The screenshot shows the Siebel Rule Sets applet. At the top is a table with columns: Name, Business Object, Business Component, Version, Status, View, and Conditional Expression. The first row is highlighted in yellow and shows 'AUT Service Request Validation' for 'Service Request' business component, version 0, with status 'In Progress'. Below the table is a detailed form for the selected rule set. The form includes fields for Name (AUT Service Request Validation), Version (0), Group (empty), Business Component (Service Request), Status (In Progress), Business Object (Service Request), Description (empty), Start Date (empty), View (empty), Aggregate Errors (checkbox), End Date (empty), and Conditional Expression (empty).

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

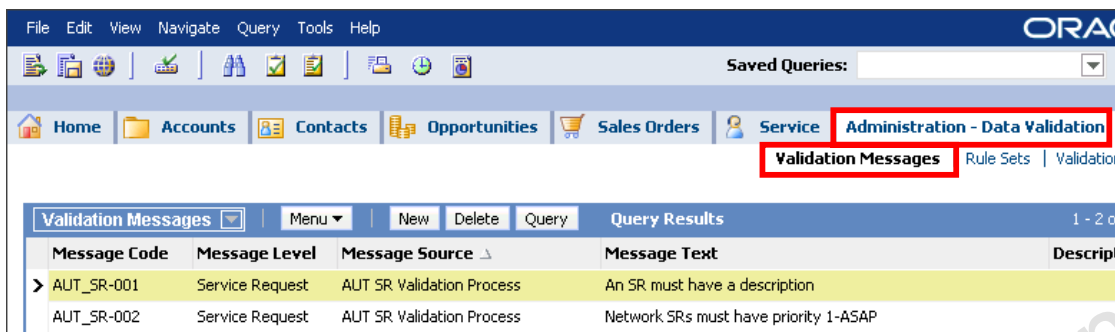

2. Set Rule Set Options

Two other options are shown in the picture above:

- Group - A tag that can be used to group multiple rule sets. The group name can be passed as a parameter to the DVM business service Validate method, and DVM will evaluate all relevant rules in the group.
- Aggregate Errors - This flag overrides rule-specific settings about displaying validation messages (discussed on a later slide). If a record violates multiple validation rules, then all related validation messages will be displayed if this flag is set.

3. Create Data Validation Messages

- Navigate to Administration - Data Validation > Validation Messages
- Create validation messages with:
 - Message Code
 - Message Source and Message Level
 - Message Text

The screenshot shows the Siebel Administration - Data Validation interface. The top navigation bar includes 'Home', 'Accounts', 'Contacts', 'Opportunities', 'Sales Orders', 'Service', and 'Administration - Data Validation'. The 'Administration - Data Validation' section is expanded, showing 'Validation Messages', 'Rule Sets', and 'Validation'. Below this, there is a table with columns: Message Code, Message Level, Message Source, Message Text, and Description. The table contains two rows of data.

Message Code	Message Level	Message Source	Message Text	Description
AUT_SR-001	Service Request	AUT SR Validation Process	An SR must have a description	
AUT_SR-002	Service Request	AUT SR Validation Process	Network SRs must have priority 1-ASAP	

3. Create Data Validation Messages

Message Code

A message code does not need to be unique, but should be easily tracked, as it may be associated with one or more rules (covered in an upcoming slide).

Message Source and Message Level

Message source describes the business process that the message belongs to and the message level identifies which part of this process the message is associated with. These two fields can be used to organize a complex set of validation messages.

Example: Message Source is AUT Order and Quote Validation, which is the name of our business process. Message Level could be Order or Quote, depending on which business component the validation message applies to.

Localization

Validation messages include multi-language support. The Validation Messages view has a child applet where message translations can be entered.

4. Add Data Validation Rules

- Drill down on the rule set name in the Rule Sets applet
- Create rules and specify:
 - Sequence #: determines the order of rule evaluation
 - Name: a string that names the rule
 - Expression: An expression in Siebel Query Language
 - If using a business component field, you must know its name
 - May not correspond to the list column name or form control label
 - Return Code: discussed on next slide

The screenshot shows the Siebel Rule Sets applet with the 'Rules' tab selected. A table lists one rule with the following details:

Sequence #	Name	Expression	Business Compon	Apply To	Return Code
> 1	SR must have description	[Description] IS NOT NULL	Service Request	Current Record	

Enter expression or click the select control to bring up the Expression Designer

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Add Data Validation Rules

The Expression Designer is a Java applet to help you build expressions in Siebel Query Language. This tool provides easy access to business component fields, operators, and functions, and supports construction of complex expressions. You will use the Expression Designer in a practice for this lesson.

5. Associate Validation Messages with Rules

- For each rule, specify a Return Code that matches the Message Code for the correct validation message
 - Click the Select control to choose the code from a pick applet

Use Return Code to associate a rule with a validation message

The screenshot shows two windows. The top window is a rule configuration table with columns: Sequence #, Name, Expression, Business Component, Apply To, and Return Code. Row 2 is highlighted, showing 'Network is highest priority' with Return Code 'AUT_SR-002'. A red box highlights the 'Return Code' column, and a red arrow points to the 'Validation Messages' window below. The bottom window is titled 'Validation Messages - Microsoft Internet Explorer' and contains a table with columns: Message Code, Message Level, Message Source, and Message Text. Row 1 is highlighted, showing 'AUT_SR-002' with Message Source 'AUT SR Validation Process'. A yellow callout box points to the first row of the bottom table with the text 'Select a message'.

Sequence #	Name	Expression	Business Component	Apply To	Return Code
1	SR must have description	[Description] IS NOT NULL	Service Request	Current Record	AUT_SR-001
2	Network is highest priority	IIF([INS Product]='Network',[Priority]='1-ASAP', "Y")	Service Request	Current Record	AUT_SR-002

Message Code	Message Level	Message Source	Message Text
AUT_SR-002	Service Request	AUT SR Validation Process	Network SRs must have priority 1-ASAP
CME VP Approval	Quote	Quote Approval	The quote total exceeds the 100,000 limit. Approval is needed
Claim-01	Claim Policy Informa	Claim Validation	Loss Date of claim cannot be null.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

6. Add Actions to Rules

- Select the Actions tab in the applet below the Rules applet
- Optionally, specify one or more actions for a rule
- Action can be:
 - Update a business component field
 - Invoke a business service method

The screenshot shows the 'Actions' tab in the Siebel interface. It contains two tables. The first table lists actions with columns: Sequence #, Type, Business Component, Business Service Name, and Business Service Method. The second table, 'Field Values', shows the field 'Status' with the value 'Needs Correction'.

Sequence #	Type	Business Component	Business Service Name	Business Service Method
1	Business Component	Service Request		
2	Business Service		ServiceReqEMHelpDesk	InsertAndQuery

Field	Value
Status	Needs Correction

Annotations in the image:

- A yellow box with a red bracket pointing to the first two rows of the first table: "Update a BC field or call a business service method".
- A yellow box pointing to the 'Status' field in the second table: "If updating a BC field, specify field and value".

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

6. Add Actions to Rules

Example

The screenshot in this slide shows both types of action for a rule. The first action results in update of the Service Request Status field to "Needs Correction". The second action results in invocation of the InsertAndQuery method for the ServiceReqEMHelpDesk business service. Both actions would run after their parent rule evaluates to FALSE.

Business Service Context

If an Action is to invoke a business service method, you can also specify input argument names and values to be passed to the method by using the Business Service Context field (not shown).

7. Specify Rule Detail

- Select Rule Detail in the applet below the Rules applet
- Enter rule options:
 - Stop on Error: if set and the rule is FALSE, then do not evaluate additional rules in the rule set
 - Immediate Display: if set and the rule is FALSE, then immediately display the rule's error message

The screenshot shows the 'Rule Detail' applet with the following fields and values:

Field	Value
Name	Network is highest priority
Sequence #	2
Description	
Apply To	Current Record
Business Component	Service Request
Expression	IIF([INS Product]='Network
Return Code	AUT_SR-002
Message	Network SRs must have priority 1-ASAP
Stop On Error	<input checked="" type="checkbox"/>
Immediate Display	<input checked="" type="checkbox"/>

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

7. Specify Rule Detail

The rule set option Aggregate Errors will display all validation messages for a record, and will override the Stop on Error rule option. Instead of stopping after the first validation error, DVM will evaluate all rules in the rule set and display all validation messages that are triggered.

8. Activate the Rule Set

- After defining all rules, return to the Rule Sets list applet
- Click Activate
 - Rule set Status changes to Active
 - An active rule set can be modified by clicking Revise
 - A new version is created and marked In Progress

The image displays two screenshots of the Siebel Rule Sets list applet, illustrating the process of activating a rule set. The top screenshot shows the 'AUT Service Request Validation' rule set with a status of 'In Progress'. The 'Activate' button is highlighted with a red box. The bottom screenshot shows the same rule set with a status of 'Active'. The 'Revise' button is highlighted with a red box, and a red arrow points from the 'In Progress' status in the top screenshot to the 'Active' status in the bottom screenshot.

Validation Rule Set | Menu | New | Delete | Query | Query Results | 1 - 1 of 1 | **Activate** | Revise |

Name	Group	Business Component	Version	Status	Business Object	View
> AUT Service Request Validation		Service Request	0	In Progress	Service Request	

Validation Rule Set | Menu | New | Delete | Query | Query Results | 1 - 1 of 1 | **Revise** |

Name	Group	Business Component	Version	Status	Business Object	View
> AUT Service Request Validation		Service Request	0	Active	Service Request	

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking Data Validation Manager

- Siebel Customer Order Management includes built-in support for DVM invocation for Orders and Quotes
 - Includes quote and order validation that can be invoked from the user interface
- Because DVM is a business service, it can be invoked by:
 - A workflow process
 - A Siebel task (covered in another lesson)
 - A run-time event
 - A custom control

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking Data Validation Manager

Customer Order Management

- Siebel Customer Order Management is a comprehensive set of products that supports product administration, quote-to-order, and pricing.

Invoking DVM in a Workflow or Task

- The DVM business service can be added as a step in a workflow process or task.

Invoking DVM from a Runtime Event

- A call to the DVM Validate method can be added directly to the action set for a runtime event. Runtime events and their action sets are administered in the Administration - Runtime Events screen. For more information on runtime event administration, refer to Bookshelf's *Siebel Personalization Administration Guide*.

Invoking DVM from a Custom Control

- A toolbar item, such as a button, or a menu item can invoke a Command object, which can call the DVM business service. This is similar to invoking a workflow process from a custom control, which is covered in another lesson.

Input Arguments for the DVM Business Service

- When invoking the DVM business service's Validate method, use the optional input arguments:
 - Rule Set Name: evaluate this rule set
 - Group: evaluate all rule sets in this group
 - Active Object: if Y, then use the current active business object; otherwise, you must specify the business object and the Id of a record of the corresponding BC
 - Example: specify the Service Request business object and the Id of a Service Request record
 - Enable Logging: if Y, then log all rule set evaluations

Input Arguments		Output Arguments		
Preferred Sequence	Sequence	Input Argument	Type	Value
	1	Active Object	Literal	Y
	2	Rule Set Name	Literal	AUT SR Validation

Example input arguments to the DVM Validate method

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Viewing Validation History

- If logging is enabled for DVM, view validation events in Administration - Data Validation > Validation History
- The validation history displays all rule set evaluations with status and error messages, if any

Home Accounts Contacts Opportunities Sales Orders Service Administration - Data Validation Validation Messages Rule Sets Validation History

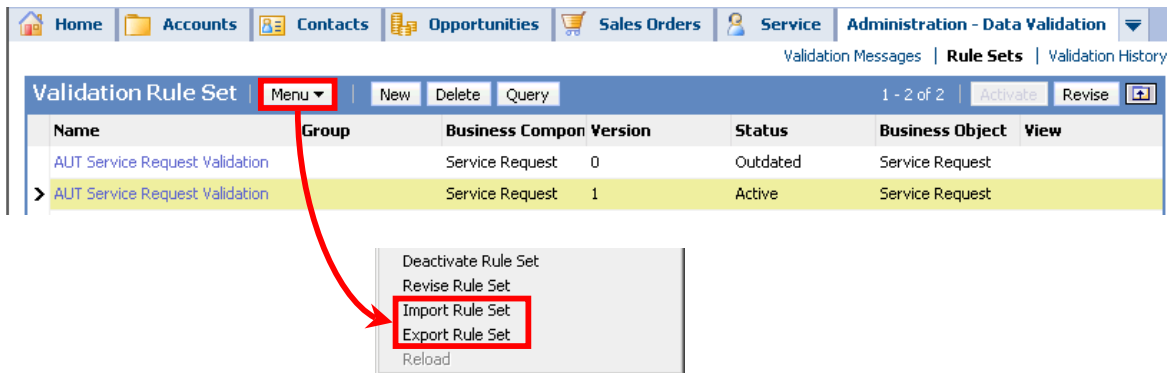

Validation History							
Menu Query Query Results 1 - 10 of 10+							
Id	Object Id	Buscomp Name	Rule Set Name	Version #	Status	Return Code	Return Message
> 85IA-7YULO	85IA-7YULL	Service Request	AUT Service Request Validation	1	Completed		
85IA-7YULK	85IA-7YULF	Service Request	AUT Service Request Validation	1	Errored Out	AUT_SR-002	Network
85IA-7YULI	85IA-7YULF	Service Request	AUT Service Request Validation	1	Errored Out	AUT_SR-001	An SR must hav
85IA-7YULB	85IA-7YUL6	Service Request	AUT Service Request Validation	0	Errored Out	AUT_SR-001	An SR must hav
85IA-7YUL9	85IA-7YUL6	Service Request	AUT Service Request Validation	0	Errored Out	AUT_SR-001	An SR must hav

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Importing and Exporting Rule Sets

- Rule sets can be exported to an XML file and then imported to another Siebel server
 - Example: Can be used to migrate validation rule sets from QA to Production servers

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Importing and Exporting Rule Sets

There is no pre-built Application Deployment Manager (ADM) support for rule sets, validation rules, or validation messages. ADM is extensible, and ADM support for these DVM data types can be added. See Bookshelf's *Siebel Application Deployment Manager Guide* for information on how to add data types to ADM.

DVM Considerations

- DVM can be used as an alternative to creating validation properties as part of application configuration
 - Configuration example: define BC field validation properties
- Tradeoffs:
 - DVM is more flexible and can handle quickly-changing business requirements without costly reconfiguration
 - BC field validation is faster than validation using DVM
- Important note for DVM: make sure to run performance tests using all anticipated rule sets
 - Measure scalability by testing with a maximum number of users
 - Consider using BC field validation for validation requirements that are unlikely to change

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Lesson Highlights

- Siebel Data Validation Manager (DVM) evaluates user-defined data validation rules
 - Can define or modify validation rules without application reconfiguration
 - Validation rules can incorporate complex logic
- Organize validation rules into rule sets
- Validation rules should evaluate to FALSE on rule violation
 - Optionally, update business component fields or invoke a business service method
- Invoke DVM by executing the DVM business service from:
 - A workflow process
 - A Siebel task
 - A run-time event

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 9 Overview: Using Data Validation Manager

This practice covers the following topics:

- Creating validation messages and a validation rule set
- Invoking DVM in a workflow process

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

10

Siebel Task UI

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Describe the features of Siebel Task UI
- Invoke and complete a task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Business Challenge

- Many tasks require users to perform several steps to complete the task
 - Users may not be familiar with the sequence of steps
 - Users may inadvertently skip a step
 - Users often require additional training to complete the task
- Companies would like to implement a user interaction style that assists users in completing such tasks

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Business Solution: Siebel Task UI

- Uses a wizard-like interface to guide users through steps in a task
 - Consists of a sequenced set of views, each of which collects a small set of relevant data from the user
- Extends business process automation to the UI layer

The screenshot shows the Siebel Task UI interface for creating a contact. The top navigation bar includes links for Home, Accounts, Contacts, Opportunities, Sales Orders, Service, Quotes, and Administration - Product. The left sidebar, titled 'Current Task', shows a tree view with 'Create a Contact' expanded, containing 'General Information' (selected), 'Add Contact Info', 'Next Steps', and 'Summary'. The main content area is titled 'Create a Contact: Add Contact Info' and features a 'General Contact Information' section. This section contains several input fields: First Name (required), Middle Name, Last Name (required), Home Phone, Mobile Phone, Work Phone, Gender (dropdown), Salutation (dropdown), Contact Method (dropdown), and Email Address. Navigation buttons (Pause, Previous, Next, Cancel) are located at the top right and bottom right of the form. A message at the bottom of the form reads 'DDEV, Please enter contact information'.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Business Solution: Siebel Task UI

Siebel Task UI extends business process automation to the UI layer as Task UI allows developers to build tasks that direct users through a series of task views in a prescribed order. Siebel Task UI also replaces the use of Interactive Workflows.

Features of Siebel Task UI

- Task UI supports:
 - Forward and backward navigation through a sequence of views
 - Allows for a set of records to be reviewed and corrected prior to completion of the task
 - Branching based on user input
 - Pausing and resuming tasks if users are interrupted
 - An instance of the partially completed task is saved in the user's universal inbox
 - Context and all data are maintained
 - Task is resumed from the universal inbox
 - Transfer of paused tasks to other users

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Features of Siebel Task UI

Task UI

Task UI refers to both the wizard-like style of the user interface as well as to the underlying Task UI framework that consists of the development, run-time, and administrative features that support this type of user interface

Task

The term task (in the context of Siebel Task UI) refers in general to a unit of work to be performed by a user as part of larger business process. The term task is also used to refer to a specific task developed using the Task UI framework.

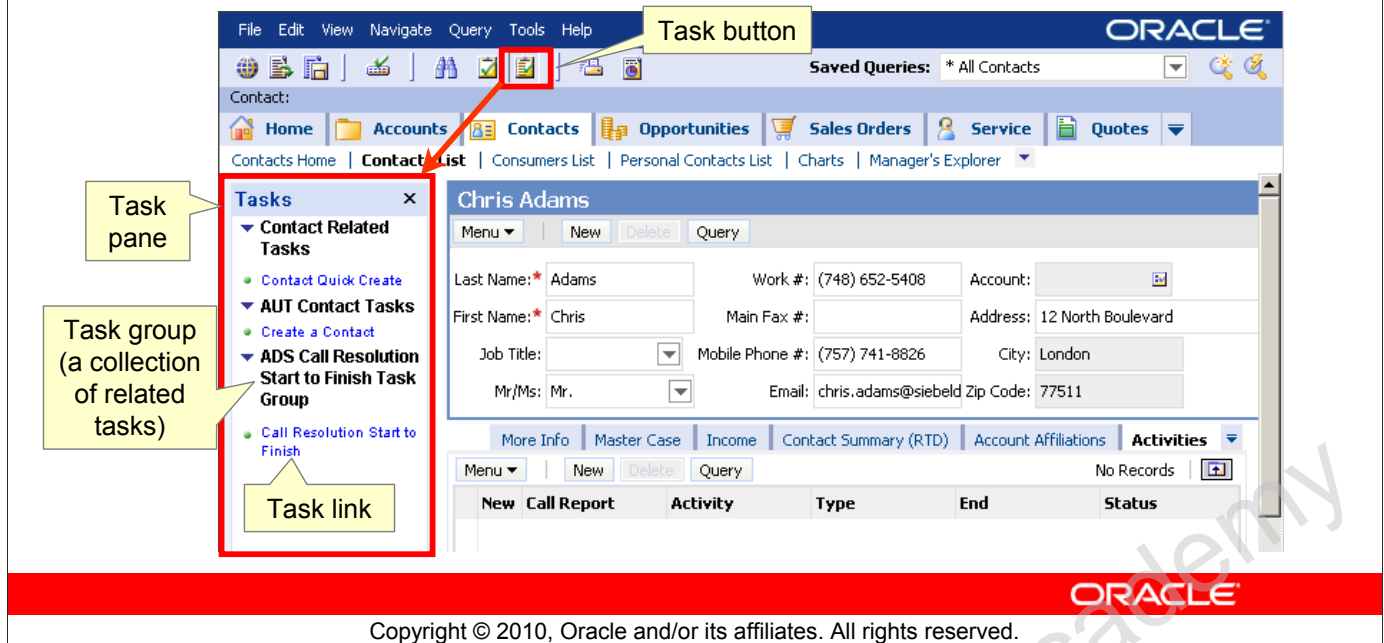

Bookshelf uses the term "task UI" to refer to a task as created by a developer. This course uses the term task.

Reference

“Overview of Siebel Task UI” in *Siebel Business Process Framework: Task UI Guide*

Using Task UI

- Click the Task button to expose the task pane
 - Displays links to tasks that can be invoked in the current application context

Using Task UI

Task Group

A task group can be associated with a specific view or can be configured to appear in all regular views. An individual task is also assigned to a responsibility and a task link will appear only for users with the corresponding responsibilities.

Invoking a Task

- Click the link for the desired task
 - A task view replaces the standard Siebel view
 - Task pane displays other views in the task
 - Provides context for the overall task
- Enter data in fields in the first view
- Click Next to proceed to subsequent views

Task pane shows current position in task

Click Next to proceed

Enter data

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking a Task

Reference

“Siebel Task UI Interface Elements” in *Siebel Business Process Framework: Task UI Guide*

Invoking a Task

- Task views are typically characterized by:
 - Small number of fields in each applet in the view
 - A set of navigation buttons (the playbar applet) located above and/or below the applets
 - Absence of navigation options such as view tabs and hyperlinks

Task view

Playbar applet

Small number of related fields

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Progressing Through a Task

- Enter data in each subsequent view
- Click Next to proceed
- Click Previous to return to the prior view to inspect or modify previously entered data

The screenshot shows the Siebel CRM interface for creating a contact. The top navigation bar includes Home, Accounts, Contacts, Opportunities, Sales Orders, Service, and Quotes. The task pane on the left is titled 'Current Task' and shows a list of steps: 'Create a Contact', 'General Information', 'Next Steps', 'Pick an option', 'Add Activity to Contact' (highlighted), and 'Summary'. The main area is titled 'Create a Contact: Add Activity to Contact' and contains the 'Activity Information' form. The form has the following fields: Description (Send email to welcome), Status (Scheduled), Started (empty), Due (08/29/2008 3:22:10), Priority (empty), Type (Email), and Owned By (DDEV). At the bottom of the form are buttons for Pause, Previous, Next, and Cancel. A yellow callout box points to the task pane with the text: 'Task views in a chapter are listed as the user navigates to the view'.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Progressing Through a Task

Task Chapter

A task chapter is an optional grouping of sequential task steps. When task chapters are configured, only the task chapters are shown at first in the task pane. When a user reaches a task step in a task chapter the chapter is expanded and all the steps in that chapter are then displayed. Task chapters provide a mechanism for showing the high-level flow.

Branching in a Task

- Tasks can branch based on data the user inputs
 - Example: branching based on lead quality of an opportunity
- Some views may explicitly present the user with a choice about the next step to be executed
 - Select the desired activity and click Next

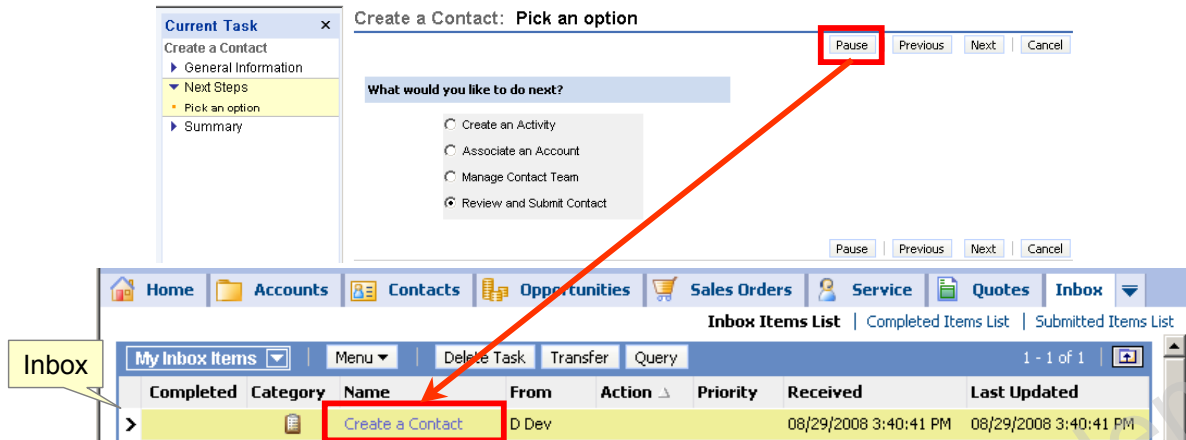

The screenshot displays the Siebel CRM interface for the 'Create a Contact' task. The top navigation bar includes links for Home, Accounts, Contacts, Opportunities, Sales Orders, Service, Quotes, and Administration - Product. On the left, a 'Current Task' pane shows the task structure: 'Create a Contact' with sub-tasks 'General Information', 'Next Steps' (expanded), 'Pick an option' (selected), and 'Summary'. The main content area is titled 'Create a Contact: Pick an option' and contains a section 'What would you like to do next?' with four radio button options: 'Create an Activity', 'Associate an Account', 'Manage Contact Team', and 'Review and Submit Contact'. The 'Review and Submit Contact' option is selected. A red box highlights these options, and a yellow callout box points to them with the text 'User makes a selection'. Navigation buttons (Pause, Previous, Next, Cancel) are visible at the top and bottom of the main content area.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Pausing a Task

- Click Pause to suspend task activity
 - All data and context is retained
 - A link to the paused task is added to the user's inbox
- Navigating outside the task view implicitly pauses a task
 - For example, clicking a screen tab or the site map button

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Resuming a Task

- Click the link in the Inbox to resume the task
 - Task resumes exactly where it was paused

The screenshot illustrates the Siebel CRM interface. At the top, a navigation bar includes links for Home, Accounts, Contacts, Opportunities, Sales Orders, Service, Quotes, and Inbox. Below this, a tabbed interface shows 'Inbox Items List', 'Completed Items List', and 'Submitted Items List'. The 'Inbox Items List' tab is active, displaying a table with columns: Completed, Category, Name, From, Action, Priority, Received, and Last Updated. A single item is listed with the name 'Create a Contact' and 'D Dev' as the sender. A yellow callout box labeled 'Inbox' points to the 'Create a Contact' link in the table. A red arrow points from this link to a task pane on the right. The task pane, titled 'Current Task', shows a list of steps: 'Create a Contact', 'General Information', 'Next Steps', 'Pick an option' (highlighted), and 'Summary'. A yellow callout box labeled 'Task view reappears' points to the 'Pick an option' step. The main content area of the task pane displays the title 'Create a Contact: Pick an option' and a section titled 'What would you like to do next?' with four radio button options: 'Create an Activity', 'Associate an Account', 'Manage Contact Team', and 'Review and Submit Contact' (which is selected). Navigation buttons (Pause, Previous, Next, Cancel) are visible at the bottom of the task pane.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Resuming a Task

Users can navigate to their Inbox by clicking the link at the bottom of the task pane. Also they can use the site map to navigate to the Inbox.

Completing a Task

- Review the data if a final summary view is provided
- Click Submit or Finish to complete the task
 - Commits all remaining uncommitted data to the database
- Task view closes and previous standard view is displayed

The screenshot shows the 'Create a Contact' task in Siebel. The left pane shows the 'Current Task' list with 'Contact Summary' selected. The main pane displays the 'Review Contact Information' form. The form contains fields for First Name (Chris), Last Name (Wilson), Salutation (Ms.), Gender (F), Price List, Account, Work #, Home Phone #, Email (cwi@oracle.com), Contact Method (Email), Personal Address (2389 Banana Street), City (Santa Clara), State (CA), Zip Code (94239), Country (USA), and Contact Team (DDEV). At the top right of the form, there are buttons for 'Pause', 'Previous', 'Submit' (highlighted with a red box), and 'Cancel'. Below the form is an 'Activities' table.

Description	Type	Status	Created	Started	Done	Comment	Alarm
> Send email to welcor Email	Email	Scheduled	08/29/2008 8:50:34				N

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Invoking Tasks

- Some tasks can be invoked from any view in a Siebel application
 - Example: Create a new service request
- Some tasks may require data from a record in the current view of a Siebel application
 - Such tasks:
 - Must be invoked only from views that display the record
 - Are referred to as contextual tasks
 - Example: Update an existing service request

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Contextual Task

- A contextual task is associated with a business component
 - Can only be invoked in a view that contains an applet that references the associated business component

The screenshot displays the Siebel CRM interface. At the top, a navigation bar includes links for Home, Accounts, Contacts, Opportunities, Sales Orders, Service, and Quotes. Below this, a breadcrumb trail shows 'Contacts Home | Contacts List | Consumers List | Personal Contacts List | Charts | Manager's Explorer'. The main window is titled 'George Abby' and contains a form with fields for Last Name, First Name, Work #, Main Fax #, Account, Address, Job Title, Mobile Phone #, City, and Mr/Ms. A yellow callout box points to the 'Account' field, stating 'Contact record is passed to invoked task'. On the left, a 'Tasks' pane is open, showing a tree structure with 'Contact Related Tasks', 'AUT Contact Tasks', and 'ADS Call Resolution Start to Finish Task Group'. The 'Call Resolution Start to Finish' task is highlighted with a red box. A red arrow points from this box to a 'Current Task' pane. This pane shows a list of tasks under 'Verify Contact Information', with 'Validate Customer Information' selected. To the right of the 'Current Task' pane, a 'Verify Account Information' form is displayed, containing fields for First Name, Last Name, Title, Account, Email Address, Work Phone #, Street Address, City, State, Zip, and Site. A yellow callout box points to the 'First Name' field, stating 'Contextual task, appears only if the view has a contact applet'. At the bottom of the interface, there is a red banner with the Oracle logo and the text 'Copyright © 2010, Oracle and/or its affiliates. All rights reserved.'

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Visibility of Tasks

- Tasks can also be configured to be:
 - Associated with only one or several standard Siebel views
 - Restricted to a single application
- In addition tasks are assigned in the Siebel client to one or more responsibilities
 - Only users with the responsibility see the link for the task

The screenshot shows the Siebel client interface. At the top, there are tabs for Home, Accounts, Contacts, and Administration - Application. Below these, there are links for Authentication Administration, Authentication Template, Category, and Tasks. The 'Registered Tasks' section shows a table with columns Task Name, Description, and Default Local Access. Below this, the 'Responsibilities' section shows a table with columns Responsibility, Description, and Allow Delete. The 'Responsibilities' table is highlighted with a red box, and a callout points to it with the text 'Responsibilities assigned to a task'.

Task Name	Description	Default Local Access
Email Treatment: Create		
Email Treatment: Update		

Responsibility	Description	Allow Delete
eMarketing User	Core Marketing Responsibility	✓
Siebel Administrator	Siebel System Administrator	✓
Marketing Admin	Add-on Responsibility for Marketing Administ	✓

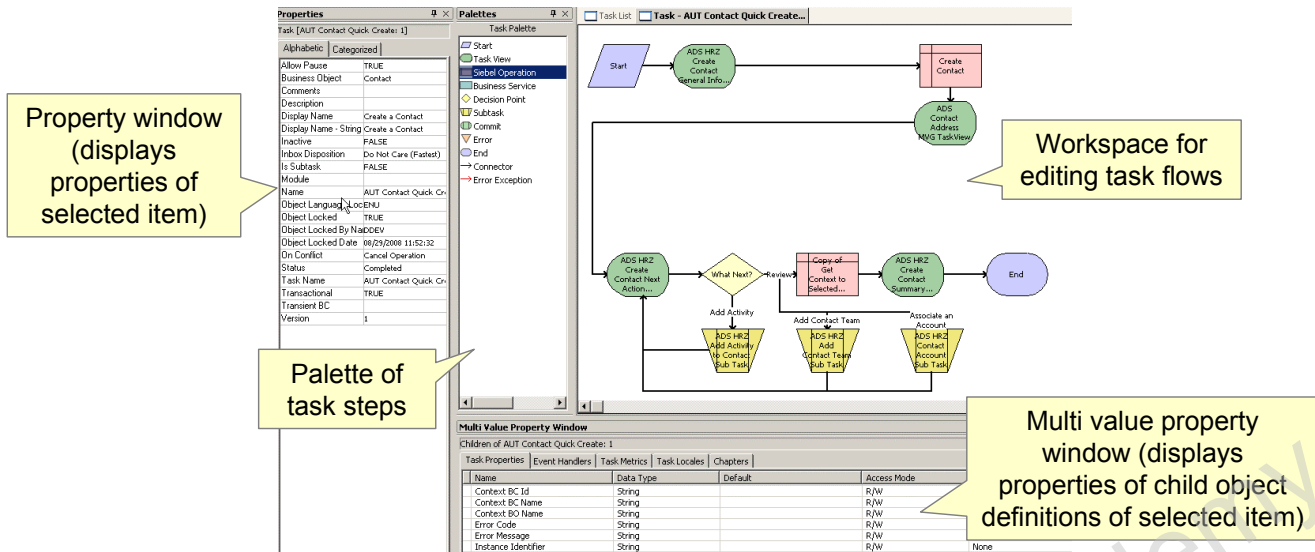

Responsibilities
assigned to a task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task Designer

- Siebel Tools includes a Task Designer used to create, examine, and modify Siebel tasks
 - Contains a palette, workspace, and property windows

ORACLE

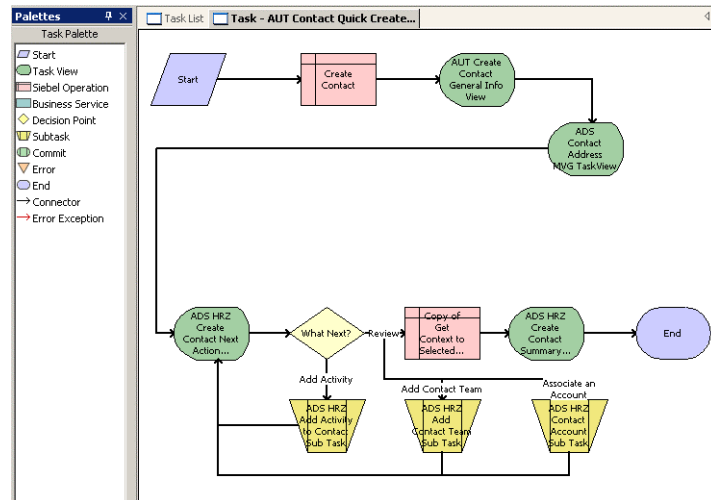

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task Designer

The Task Designer is very similar to the Workflow Designer and the two designers have many common steps.

Task Flow

- Is an ordered set of steps in a task that:
 - Displays a sequence of views to users
 - Enables users to create and modify records

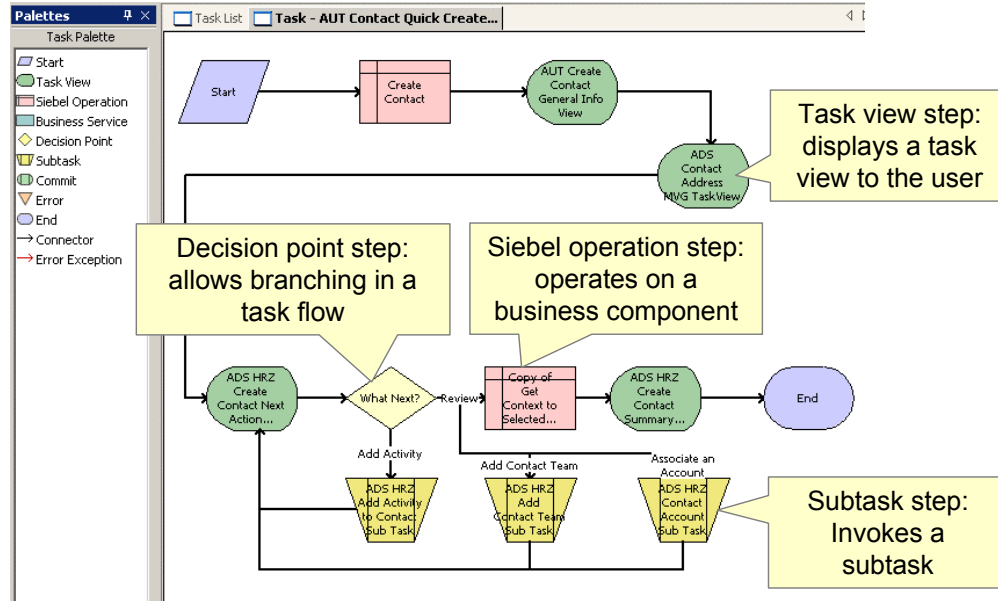

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task Flow Steps

- Task flows contain a variety of types of steps

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task Flow Steps

Reference

“Defining Steps and Connectors” in *Siebel Business Process Framework: Task UI Guide*

Committing Data to Storage

- All data entered during a task is initially stored in temporary storage managed by the Object Manager
 - Is not written to the database as the user navigates
- Persistent data is committed to the database:
 - When the task completes
 - At intermediate points in the task flow if the underlying task flow contains explicit commit steps
- Records can not be rolled back after being committed
- Data is not available to others until it is committed
- Data in temporary storage:
 - Is maintained while the task is paused
 - Is cleared only when the task is cancelled or completed

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Transient Data in Task UI

- Refers to data collected and used during the execution of a task but not saved afterwards
 - Example: user choice about the next step
- Transient data may be mapped to persistent data in a later step in the task
- Transient data disappears when the task ends

The screenshot displays the 'Create a Contact' task in the Siebel UI. On the left, a 'Current Task' pane shows the task structure: 'Create a Contact' with sub-steps 'General Information', 'Next Steps' (expanded), 'Pick an option' (highlighted), and 'Summary'. The main area is titled 'Create a Contact: Pick an option' and contains a section 'What would you like to do next?' with four radio button options: 'Create an Activity', 'Associate an Account', 'Manage Contact Team', and 'Review and Submit Contact'. The 'Review and Submit Contact' option is selected. A red rectangle highlights this selection. Below the options, a yellow callout box states: 'User's selection does not need to be stored persistently'. Navigation buttons (Pause, Previous, Next, Cancel) are visible at the top and bottom right of the main area.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Comparison of Task and Standard UI

- Consider using Task UI for tasks that:
 - Are inherently complex
 - Lengthy, complex sets of inputs, lots of branching
 - Are performed by novice or infrequent users
 - Can take advantage of the ability to pause and transfer tasks
 - Involve transactional processing
 - Might be integrated with workflows
- Consider using the standard UI for tasks that:
 - Are simpler
 - Are performed frequently by power users
 - Do not involve transactional processing

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Comparison of Task and Standard UI

Transactional Processing

In Siebel Task UI, transactional processing refers to a set of actions on multiple records that must finish successfully or be completely rolled back.

In Standard UI, usually the action is on single record at a time.

Lesson Highlights

- Siebel Task UI is a wizard-like interface that guides users through steps in a task
- Invoke a task from a link in the task pane
- Use the buttons in the playbar applet to proceed, return to the previous view, pause, or complete the task
 - Paused tasks are resumed from the universal inbox
- Data collected during a task is not committed to the database
 - Until the task is completed
 - Or is explicitly committed at specific points in the task
- Use the Task Designer to create, examine, and modify Siebel tasks

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 10 Overview: Siebel Task UI

This practice covers the following topics:

- Executing a task
- Examining a task using the Task Designer

ORACLE

11

Creating a Task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Configure a task
- Administer a task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Creating a Task

- Consists of the following:
 - Configuring task UI object definitions using Siebel Tools
 - Task flow
 - Task view
 - Task group
 - Deploying the task to the run-time client
 - Administering the task in the run-time client

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

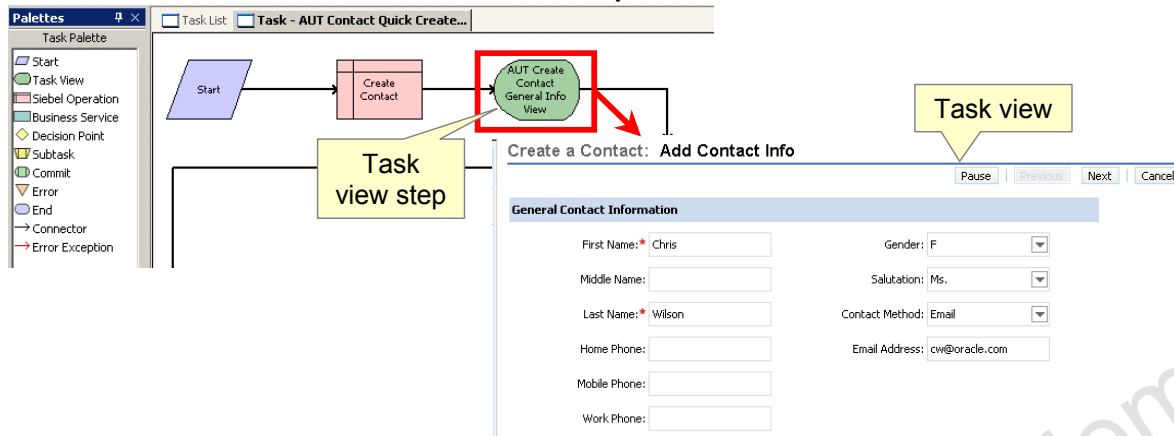

Creating a Task

Reference

“Defining UI Objects” in *Siebel Business Process Framework: Task UI Guide*

Task View

- Is a special type of view used in a task
 - Displays data to a user
 - Allows a user to edit data
- Consists of one or more applets and the playbar applet
- Is invoked in a task view step in a task flow

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task View

Reference

“Siebel Task UI Interface Elements” in *Siebel Business Process Framework: Task UI Guide*

Task Views and Standard Views

- Task views differ from standard views
 - View is not displayed in the context of a screen
 - Must use buttons in the playbar applet to navigate
 - Clicking any UI element outside the task view and task pane pauses the task and displays the prior standard Siebel view
 - Applets in a task view do not have applet menus

Create a Contact: Add Contact Info

Pause Previous Next Cancel

General Contact Information

First Name: *	Chris	Gender:	F
Middle Name:		Salutation:	Ms.
Last Name: *	Wilson	Contact Method:	Email
Home Phone:		Email Address:	cw@oracle.com
Mobile Phone:			
Work Phone:

Task Group

- Represents a collection of related tasks that can be displayed as a set in the task pane
- Can be configured to be:
 - Associated with a single standard view or available across all views
 - Restricted to a single application or available across all applications

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Creating a Task

The steps to create a task are:

1. Create the task flow
2. Create applets for the task views
3. Configure the task views
4. Bind the task views
5. Configure additional steps
6. Assign chapters
7. Create the task group
8. Compile the configured objects
9. Publish the task flow

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Create the Task Flow

- Use the Task wizard to create a Task object definition

New Task

This wizard will help you create a new Task and will automatically launch task designer.

Select the Project this Task will be part of from the list.
AUT Task UI

Enter a name for the new Task. The name must be unique among all Tasks in all Projects.
AUT Create New Contact

Enter the display name for the new Task.
Create a Contact

Select the Business Object this Task will operate on.
Contact

Select the default Transient Business Component for this Task.
[Empty field]

☐ Create as a subtask

< Back Finish Cancel

Select File > New Object, click the Task tab, and click Task

Name of task to appear in the task pane

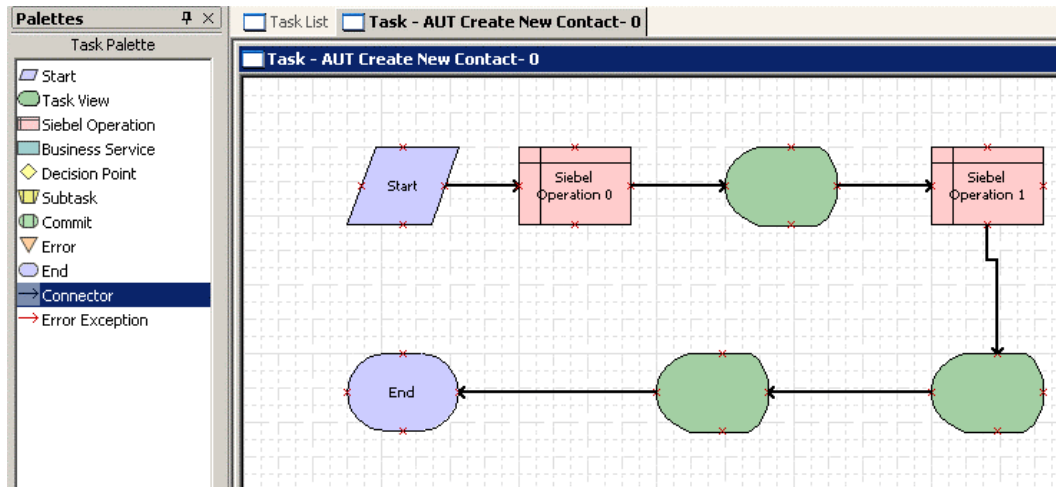

Identifies the business object for the task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Create the Task Flow: Add Task Steps

- In the Task Designer, add steps as required:
 - Drag connectors and anchor them to steps

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Create the Task Flow: Add Task Steps

The Task Designer is similar to the Workflow Designer used to build workflow processes.

2. Create Applets for the Task Views

- Use the Form Applet wizard to create applets that display a small set of focused data
- Alternatively, copy an existing applet and delete unnecessary fields

The screenshot displays the Siebel Applet Designer interface. On the left, the 'Palettes' window shows various 'Web Controls' including CheckBox, RadioButton, MiniButton, Field, ComboBox, RecNavNxt, RecNavPriv, FieldLabel, Text, FormSection, Link, TextArea, Hidden, Password, MailTo, Button, Label, URL, Custom Control, ActiveX, and PositionOnRow. The main workspace shows a form titled 'General Contact Information' with the following fields:

General Contact Information	
First Name: First Name	Gender: Gender
Middle Name: Middle Name	Salutation: Salutation
Last Name: Last Name	Contact Method: Contact Method
Home Phone: Home Phone	Email Address: Email Address
Mobile Phone: Mobile Phone	
Work Phone: Work Phone	

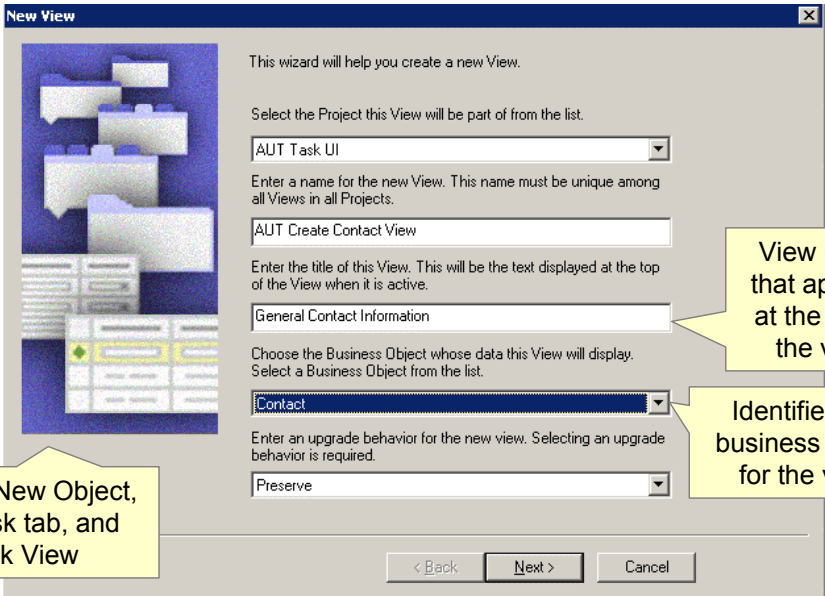

Below the form fields, there is a message: '%1, Please enter contact information'. The top of the workspace shows a menu bar with 'New', 'Edit', 'Delete', 'Save', 'Save - shows only in HI', 'Reset', 'Cancel', 'Query', and 'Go'. The title bar of the workspace indicates 'Applet List', 'Task - AUT Create New Contact- 0', and 'Applet (AUT Create Contact Appl...'.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Configure the Task Views

- Use the Task View wizard to create the task views
 - Creates a view with type = Task

Select File > New Object, click the Task tab, and click Task View

View name that appears at the top of the view

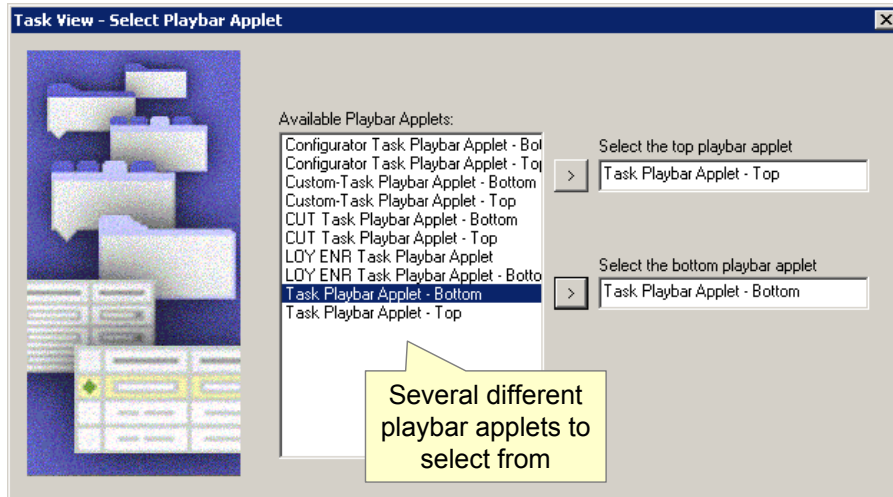

Identifies the business object for the view

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Configure the Task Views

- Use the Task View wizard to create the task views
 - Select a view Web template
 - Assign one or more customized applets
 - Add the Playbar applet to the top and/or bottom of the view

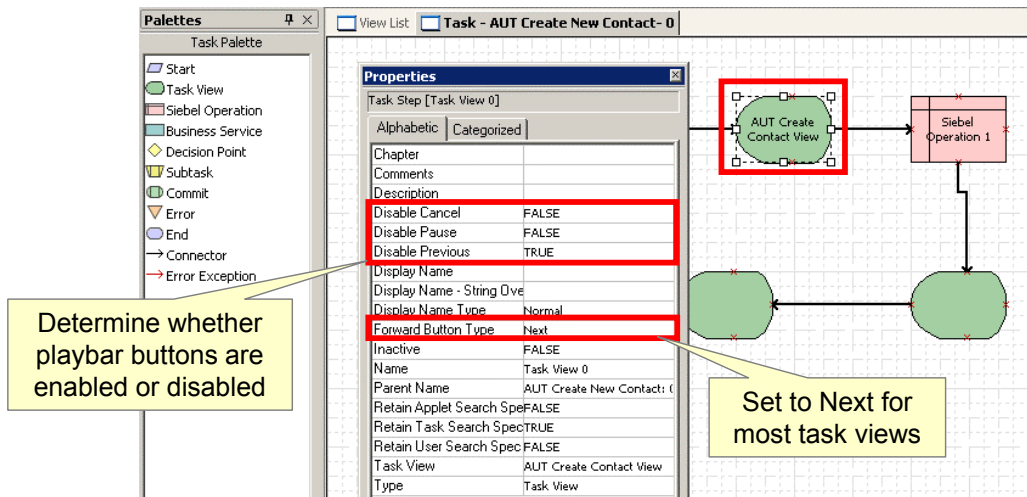

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Bind the Task Views

- For each task view step in the flow, assign a task view
 - Right-click the task step and select Bind Task View
 - Select the view from the list of available task views
 - Set the button properties for the view

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Bind the Task Views

Forward Button Type

The forward button type property determines the text that appears in the button users click to advance or complete the task. It does not determine the behavior of the task; rather it suggests to the user what will next happen. The button property can be Next, Submit, or Finish.

Submit should be used to indicate that the temporary data transaction for the task is about to be committed to permanent storage for enterprise wide consumption and, when committed, cannot be rolled back.

Finish indicates that clicking the forward navigation button ends the task. It must be used only in a task where the task transaction is fully committed before the last view.

Next indicates the task proceeds with data still in temporary storage.

5. Configure Additional Steps

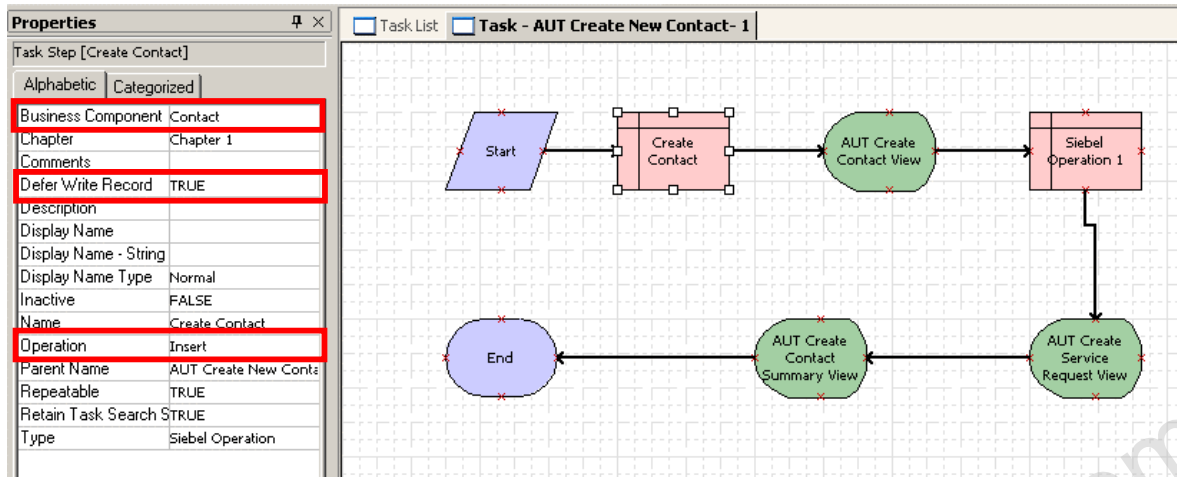

- Configure other types of steps such as:
 - Siebel Operation
 - Performs the following operations on a business component
 - Insert
 - Delete
 - Update
 - Upsert
 - Query
 - Decision Point step
 - Subtask Step
- } Discussed in
subsequent lessons

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

5. Configure Additional Steps: Configuring a Siebel Operation Step

- Specify the business component and operation
- Set the Defer Write property to TRUE to allow the task to proceed without any required fields being entered in the first step

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

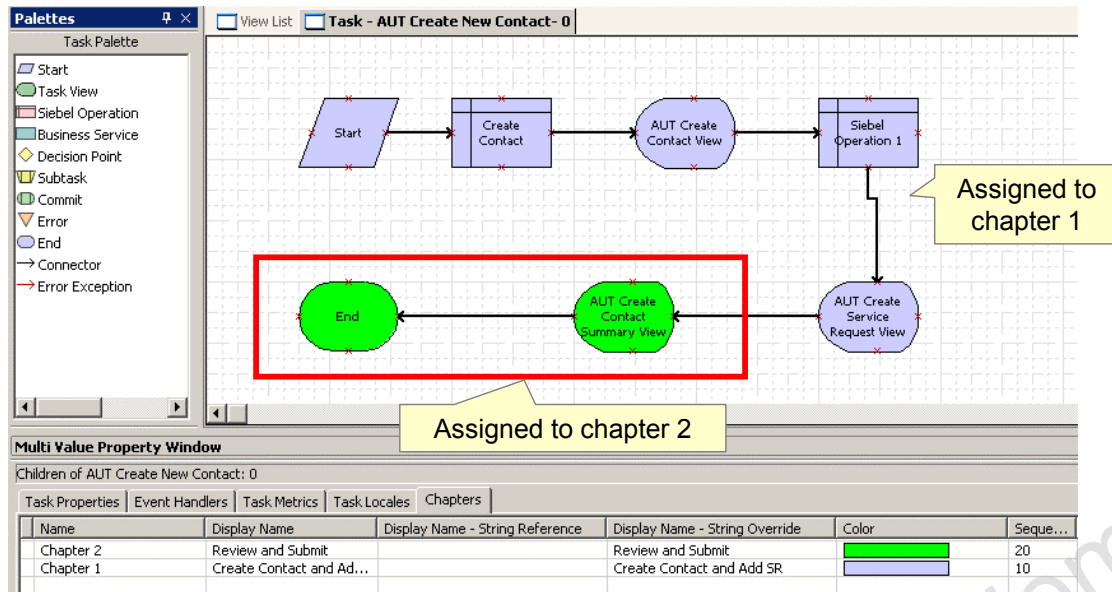

5. Configure Additional Steps: Configuring a Siebel Operation Step

Defer Write Record Property

Setting the Defer Write Record property to True allows a task to collect all the required fields for a business component in several different task views before the record is committed to permanent storage. In particular it allows an insert Siebel operation step to appear prior to a task view in which a user first enters data for the business component

6. Assign Chapters

- Optionally, create chapters to group steps in the task pane
- Assign each step to a chapter

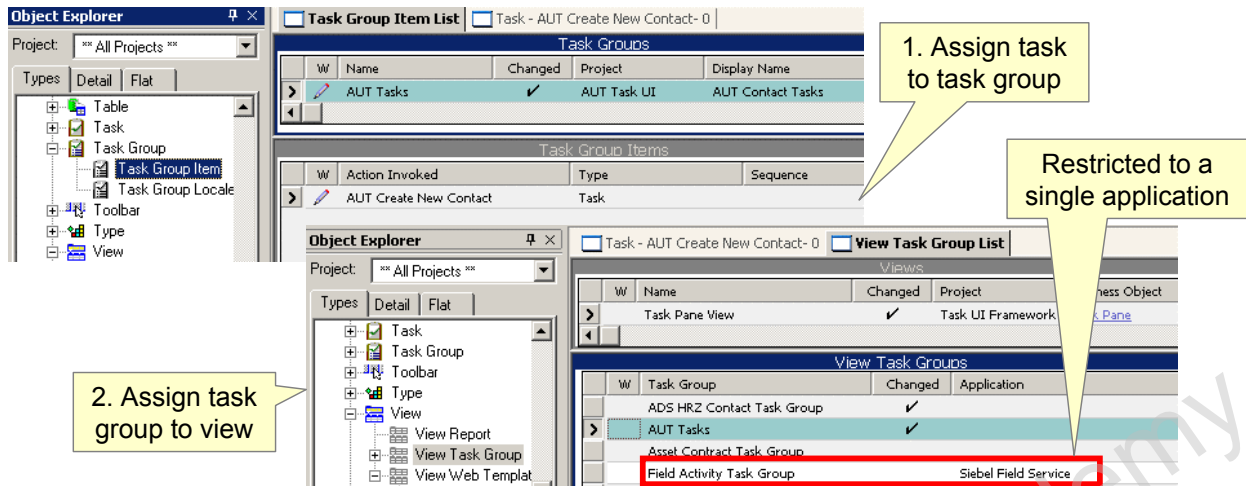

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

ORACLE

7. Create the Task Group

- Assign the Task to an existing (or new) Task Group
 - Groups several tasks in the task pane
- Assign the Task Group to a view
 - Assign to Task Pane View to make tasks visible in all views

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

7. Create the Task Group

A task can be assigned to several task groups if required. A task group can be assigned to several views.

7. Create the Task Group: Assign Context Business Component

- For tasks that require a context business component
 - Set the Require Context BC property in the task group to TRUE
 - Identify the context business component for the task group item

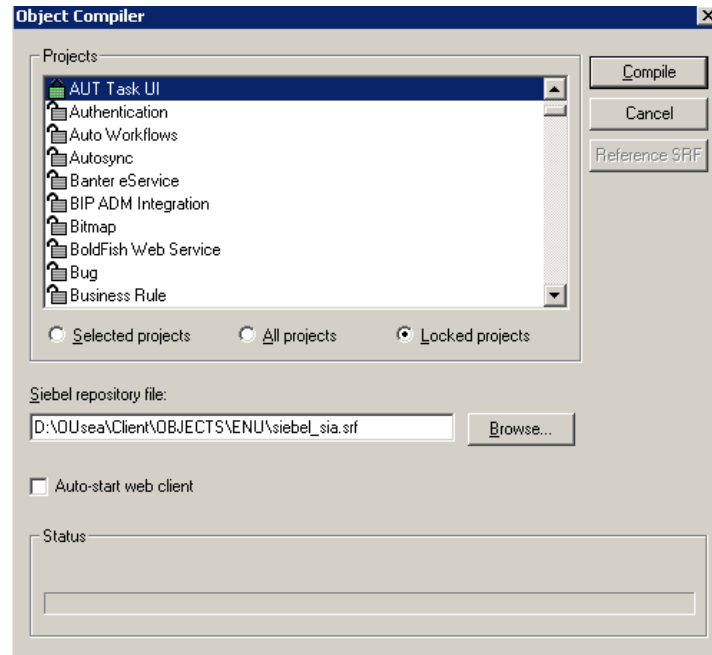

The context business component is the business component associated with a contextual task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

8. Compile the Configured Objects

- Compile the configured objects into the target SRF file

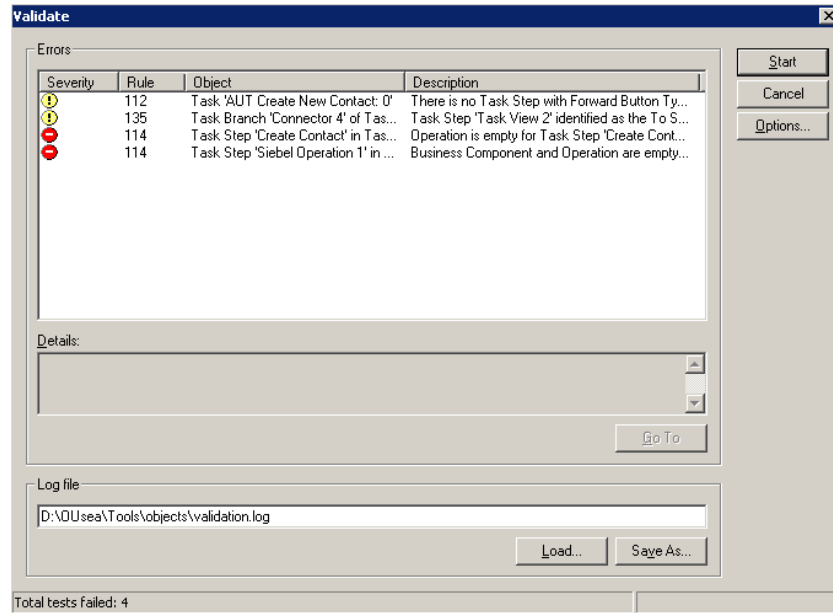

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

9. Publish the Task Flow

- First, validate the task flow to identify any possible errors
 - Right-click and select Validate

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

9. Publish the Task Flow

A task object definition is not compiled, so it can be validated and deployed after the views and applets have been compiled.

9. Publish the Task Flow

- Click the Publish button in the Deployment toolbar to deploy the task flow
 - Sets the task flow to complete
 - Makes it available for activation

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Administering a Task

The steps to administer a task are:

1. Activate the task flow
2. Register the task flow
3. Assign responsibilities

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Activate the Task Flow

- Navigate to Administration - Business Processes > Task Deployment
- Select the published task and click Activate
 - Makes the task available for use in the client
- Alternatively Publish/Activate directly from Siebel Tools

The screenshot shows the Siebel Administration interface. The top navigation bar includes Home, Accounts, Contacts, Opportunities, Sales Orders, Service, and Administration - Business Process. The left sidebar shows Workflow Policies, Workflow Policy Actions, Workflow Policy Explorer, Workflow Policy Groups, Workflow Policy Log, and Task Deployment. The main content area is titled 'Published Tasks' and has a red box around the 'Activate' button. Below the button is a table with the following data:

Name	Business Object	Status	Version
AUT Contact Quick Create	Contact	Completed	1
AUT Contact Quick Create - start	Contact	Completed	5
> AUT Create New Contact	Contact	Completed	0

Below this table is a section titled 'Child Items' and 'Active Tasks'. It has a red box around the 'Active' button. Below the button is a table with the following data:

Name	Version	Repository Versic	Business Object	Deployment Stat	Activation Date/	Expiration D
> AUT Create New Contact	0	0	Contact	Active		
AUT Contact Quick Create - start	5	5	Contact	Active		

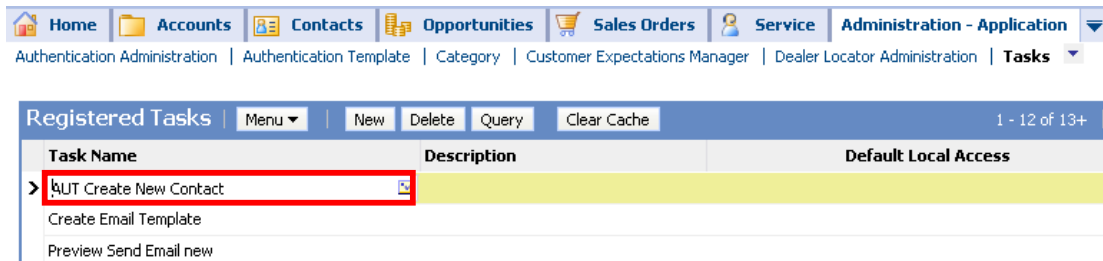

A yellow callout box labeled 'Activated tasks' points to the 'Active' button in the 'Active Tasks' section.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Register the Task Flow

- Navigate to Application - Administration > Tasks
- Create a new record and select the task from the list of published tasks

The screenshot shows the Siebel application interface. The top navigation bar includes tabs for Home, Accounts, Contacts, Opportunities, Sales Orders, Service, and Administration - Application. Below the navigation bar, a breadcrumb trail shows the path: Authentication Administration | Authentication Template | Category | Customer Expectations Manager | Dealer Locator Administration | Tasks. The main content area displays a table titled "Registered Tasks". The table has three columns: Task Name, Description, and Default Local Access. The first row is highlighted in yellow and contains the text "&UT Create New Contact". Below this row, there are two more rows: "Create Email Template" and "Preview Send Email new".

Task Name	Description	Default Local Access
&UT Create New Contact		
Create Email Template		
Preview Send Email new		

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Assign Responsibilities

- Add one or more responsibilities to the registered task
 - Allows users with the responsibility to see the task in the task pane
 - Click Clear Cache to update the cache

The screenshot displays two panes from the Siebel Business Automation interface. The top pane, titled 'Registered Tasks', contains a table with columns: Task Name, Description, and Default Local Access. It lists one task: 'AUT Create New Contact'. Above this table is a toolbar with buttons: Menu, New, Delete, Query, Clear Cache (highlighted with a red box), and Query Results. The bottom pane, titled 'Responsibilities', contains a table with columns: Responsibility, Description, Allow Delete, Allow Transfer, Local Access, and Web Access. It lists one responsibility: 'Siebel Administrator' (highlighted with a red box), with description 'Siebel System Administrator' and checkmarks in the 'Allow Delete' and 'Allow Transfer' columns. A yellow callout box with a pointer to the 'Siebel Administrator' row contains the text 'Adds the task to this responsibility'.

Task Name	Description	Default Local Access
> AUT Create New Contact		

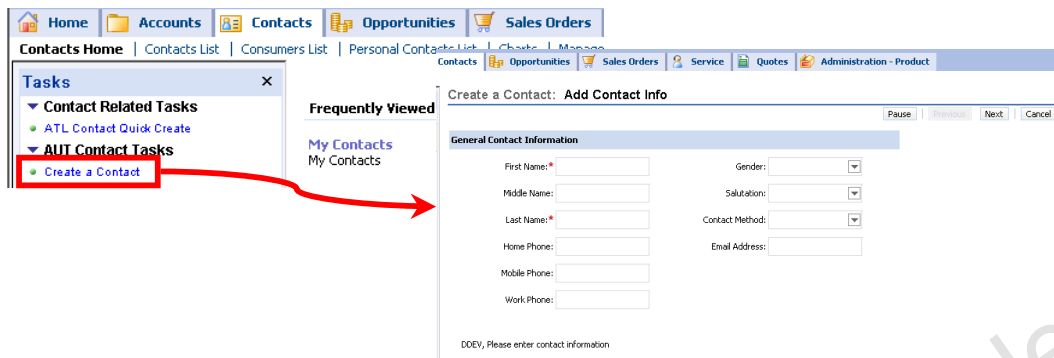

Responsibility	Description	Allow Delete	Allow Transfer	Local Access	Web Access
> Siebel Administrator	Siebel System Administrator	✓	✓		

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Testing the Task

- Navigate to a view to which the task is assigned
- Click the Tasks button to display the task pane
 - Verify that the desired task appears
 - Verify that the task link appears only for:
 - Users with an assigned responsibility
 - Assigned views if so configured
- Click the task link and execute the task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Lesson Highlights

- Creating a task in Siebel Tools consists of:
 - Configuring a task flow
 - Creating and binding task view steps
 - Assigning steps to chapters
 - Adding the task to a task group
 - Assigning the task group to a view
 - Publishing the task to the run-time client
- Administering the task in the run-time client consists of:
 - Activating the task
 - Registering the task
 - Adding the task to one or more responsibilities

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Practice 11 Overview: Creating a Task

This practice covers the following topics:

- Creating a task
- Deploying and administering the task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

12

Transient Business Components

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Describe the role of transient business components and task applets
- Configure branching logic in a task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Transient Data

- Refers to user-edited data that:
 - Is processed by subsequent steps in the task
 - Does not need to be stored persistently after the task completes
- Examples:
 - Selection made by a user to determine task flow
 - Data entered by a user that may be processed before being stored in a regular business component

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Transient Data

Reference

“Reference Materials for Siebel Task UI” in *Siebel Business Process Framework: Task UI Guide*

Transient Business Component (TBC)

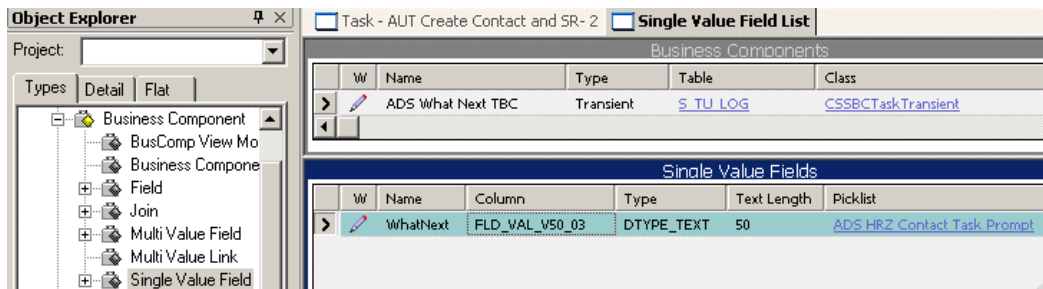

- Is a special type of business component used to store transient data
 - Type is transient
 - Has one or more single value fields
 - Does not support joins or multi value fields
- Is managed by the Object Manager
 - All transient business component records are stored in a special table: S_TU_LOG
 - Transient business component records are automatically deleted upon committing data or canceling a task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Configuring a Transient Business Component

- A TBC can be configured as either:
 - A single record TBC that can store one and only one record
 - Example: a TBC to store the user's "next" choice
 - A multi-record TBC that can store one or more records
 - Example: A TBC to store one or more proposed offers before one is selected to be stored persistently
- Always use the Transient BusComp wizard to create a TBC
 - Ensures that class and other properties are set as required

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

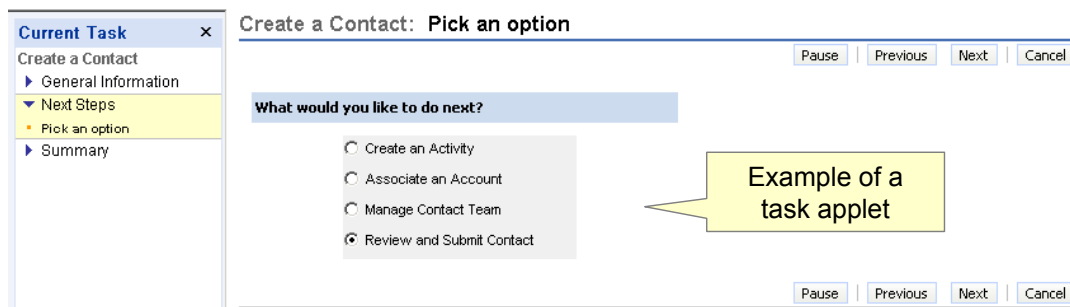

Configuring a Transient Business Component

Transient Business Components

A single record TBC uses the CSSBCTaskTransient class while a multi-record TBC uses the CSSBCTaskTransientBase class.

Task Applet

- Is a special type of applet used to display and collect transient data
 - Maps to a transient business component
 - Displays data from only that business component
- Can be assigned only to a task view
 - Can appear in a view by itself or with one or more standard applets

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task Applet

Reference

“Siebel Task UI Interface Elements” in *Siebel Business Process Framework: Task UI Guide*

Types of Task Applets

- A task applet is either a:
 - Task form applet to display a single record TBC
 - Based on the specialized class CSSSWEFrameTask
 - Uses the Applet Form Grid Layout Web template
 - Task list applet to display a multi record TBC
 - Based on the specialized class CSSSWEFrameTaskList
 - Uses the Applet List Grid (Base/EditList) Web template

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Uses for a Transient Business Component

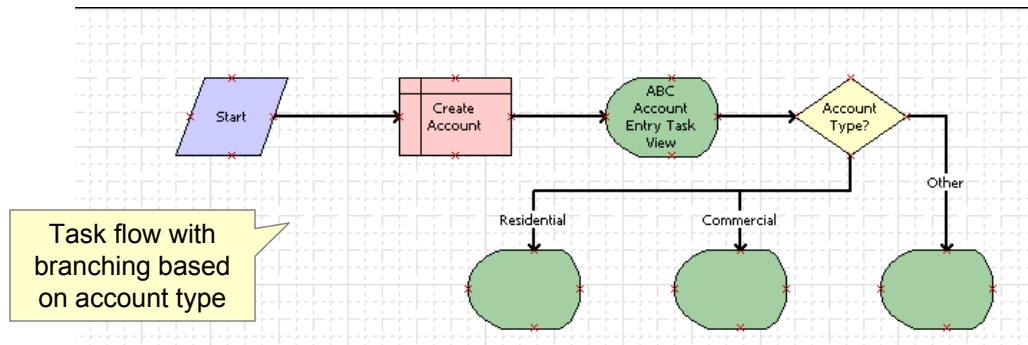

- Capture user selections that control the flow of a task at run-time
 - Discussed in this lesson
- Collect data that may be incorporated into persistent data later in the task
 - Example: collect data about a contact and then create the contact if the contact does not already exist
 - Discussed in a later lesson
- Support applets that display data from several business components
 - Example: an applet that needs to show both quote and order fields

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Branching in a Task

- The Task UI framework supports branching in a task based on user input
 - Selection can be persistent data such as the account type
 - Selection can be transient data such as the "next" choice
 - Requires the use of a transient business component
- Is implemented by configuring a decision point step

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Configuring Branching in a Task Using a TBC

The steps to configure branching in a task are:

1. Extend the task flow
2. Create a picklist
3. Create the transient business component
4. Create the task form applet
5. Create the task view
6. Configure the decision point step
7. Complete the configuration
8. Test the task

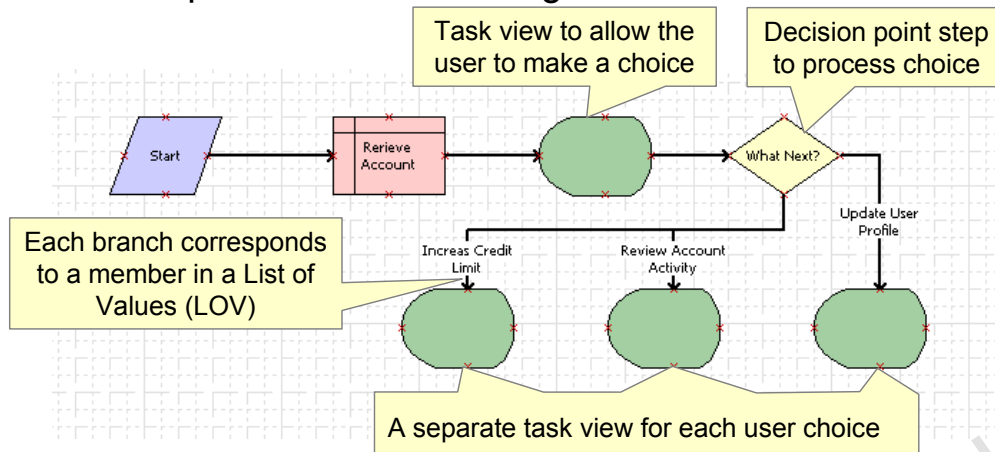

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Extend the Task Flow

- Add a task view step to the flow to allow the user to make a choice
- Add a decision point step to process the user's choice
- Add connectors to implement the desired business flow
 - Example of direct branching

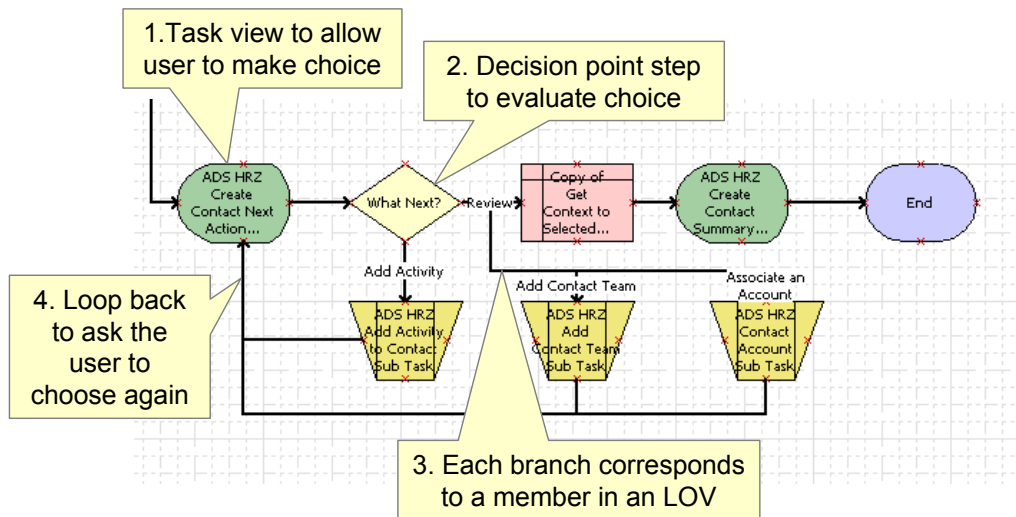

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Extend the Task Flow

- Example that involves looping or iteration

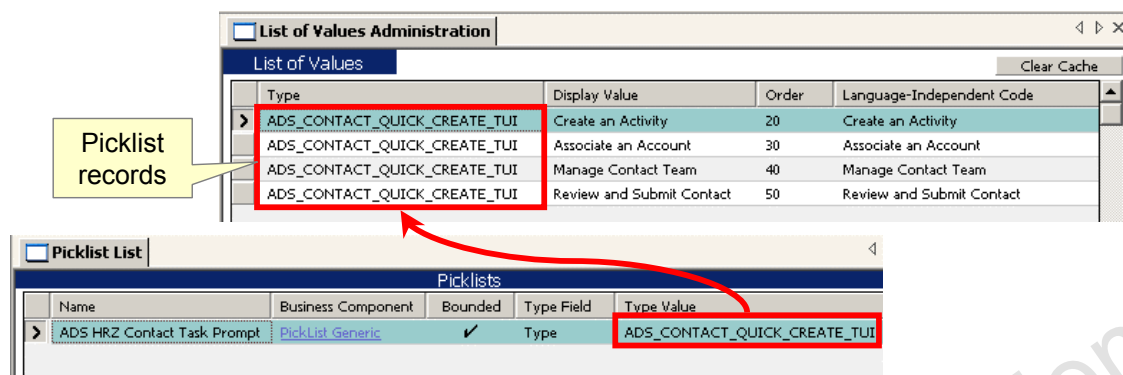

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

2. Create a Picklist

- A pick list is required when a user is presented with a set of choices
- Select an existing pick list if available
- Alternatively create a new picklist
 - Represent the choices as members of a List Of Values type
 - Configure the PickList object

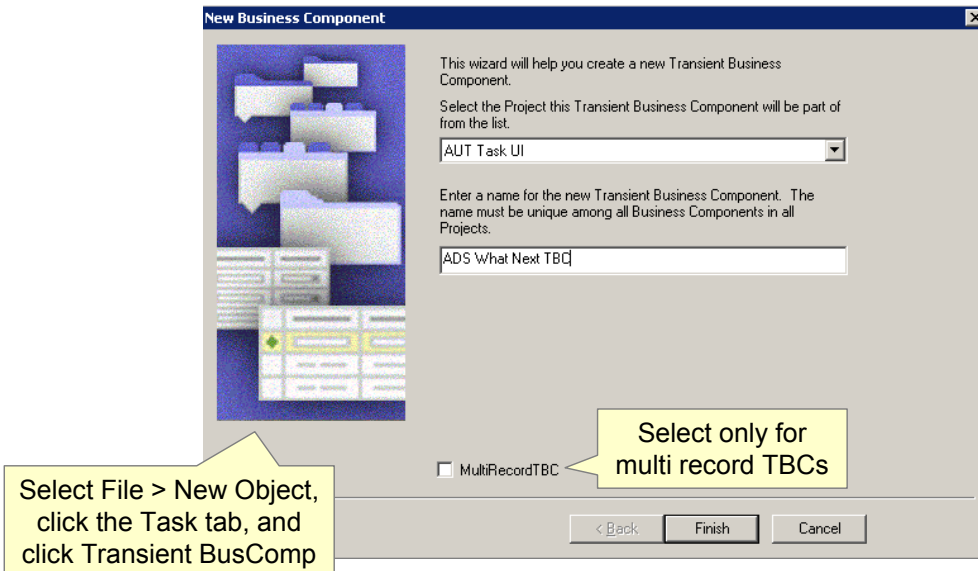

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Create the Transient Business Component

- Use the Transient BusComp wizard to create the transient business component

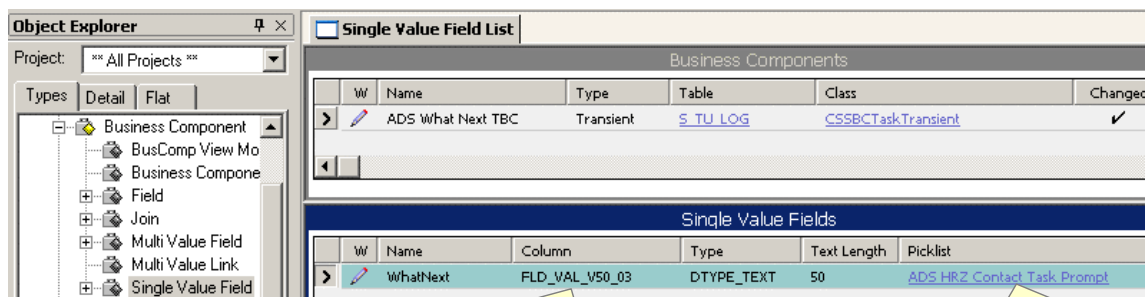

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Create the Transient Business Component

- Add one or more fields
 - Assign name, type, and length as required
 - Do not assign a column
 - Will be assigned automatically after the record is saved
 - If required, assign the picklist
 - Create the single value field pick map

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Create the Task Form Applet

- Use the Task Applet wizard to create the task applet
 - Identify the transient business component
 - Identify the task in which the applet will be used
 - Select the TBC field(s) that are to be displayed

General

This wizard will help you create a new Task Applet and will automatically place Controls for the Fields of the selected Transient Business Component.

Please select the Project this Applet will be part of from the list.

AUT Task UI

Enter a name for your new Applet. The name is used to refer to the Applet when laying out a View and cannot be the same as the name of an existing Applet.

ADS Create Contact What Next Applet

Enter the display title for your new Applet. This is the user-visible label for the Applet within the View and may be left blank if no title is desired.

Pick an Option

Select the Task this Applet will be associated with (recommended).

AUT Contact Quick Create

Enter the upgrade behavior for your new Applet. Selecting an upgrade behavior is required.

Admin

Select the Transient Business Component this Applet will be based on.

ADS What Next TBC

Select File > New Object, click the Task tab, and click Task Form Applet

Display title for applet

Assigns applet to this task only

Specify the transient business component for the applet

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

4. Create the Task Form Applet

- Inspect the applet in the Web layout editor
 - Wizard assigns a radio button control for all fields
- For fields with picklist, a radio button control:
 - Displays the members of the underlying LOV
 - Allows users to select a value by clicking a radio button
- For other fields, manually change the HTML type to the desired value
- Reposition and/or resize the label and control for each field

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

5. Create the Task View

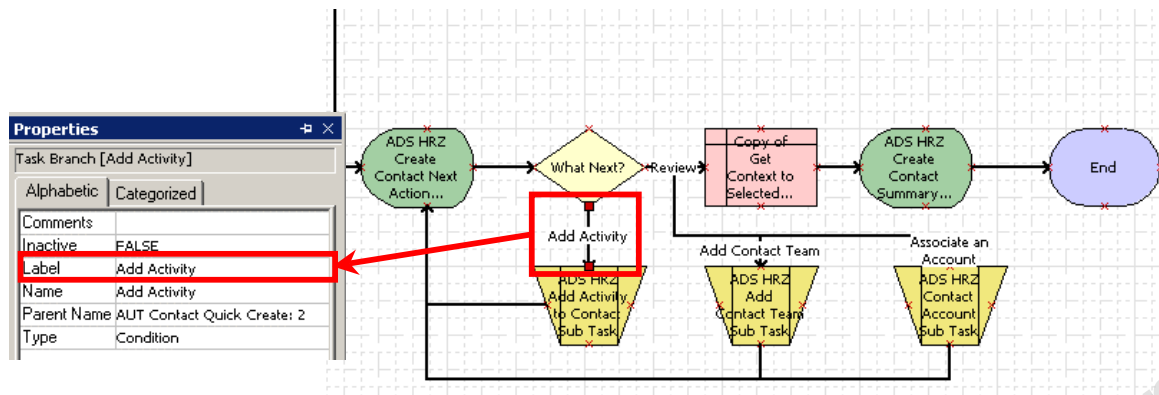

- Use the Task View wizard to create a new task view
 - Assign zero or more regular applets as required
 - Assign the task form applet
 - Select and position the playbar applet
- Alternatively add the task applet to an existing task view
 - Drag a Task Applet icon from the Applet pane to an applet placeholder
 - Select the desired task applet

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

6. Configure the Decision Point Step

- Right-click the decision point step
 - Set the name property to a meaningful value
- Right-click each connector leading from the decision point step
 - Set the label property to a meaningful value as well

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

6. Configure the Decision Point Step: Compose Conditions

- Compose the conditions for each connector
 - Right-click each connector leading from the decision point step and select Edit Conditions
 - Select TBC, field, and desired value for this branch

Compose Condition Criteria

Conditions

Compare To	Operation	Object	Field	Value
Business Co...	All Must Match (Ignore Case)	ADS...	WhatNext	Create an Activity

Compose a Condition

Compare To: Business Component

Operation: All Must Match (Ignore Case)

Object: ADS What Next TBC

Field: WhatNext

Values: Create an Activity

Buttons: New, Delete, Add, Update, Delete, OK, Cancel

Callouts: TBC (points to Object), LOV member (points to Values), Field (points to Field)

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

7. Complete the Configuration

- Configure the remaining steps (task view, Siebel operation, and so on)
- For each task view step bind the corresponding task view
 - Remember to set the Forward Button Type to Next
- Assign each step to a chapter
- Compile all new and modified objects

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

8. Test the Task

- Validate the task
- Publish and activate the task
- Invoke the task in the client and verify that the task applet appears and branches as desired

The screenshot shows the Siebel CRM interface. At the top is a navigation bar with tabs: Home, Accounts, Contacts, Opportunities, Sales Orders, Service, Quotes, and Administration - Product. Below this is a 'Current Task' sidebar on the left with a tree view containing 'Create a Contact', 'General Information', 'Next Steps' (expanded), 'Pick an option' (selected), and 'Summary'. The main content area is titled 'Create a Contact: Pick an option'. It features a 'What would you like to do next?' section with four radio button options: 'Create an Activity', 'Associate an Account', 'Manage Contact Team', and 'Review and Submit Contact' (which is selected). Navigation buttons (Pause, Previous, Next, Cancel) are located at the top right and bottom right of the main content area.

ORACLE

Lesson Highlights

- Tasks may include transient data
 - Data entered by users that does not need to be stored once the task completes
- A transient business component is required to store data entered by a user that is not required after the task completes
- A task applet is required to display data stored in a transient business component
- A task can include branching based on user entered values including transient data
- Branching requires adding a decision point step to the task flow

ORACLE

13

Additional Task UI Configuration

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Oracle Internal & Oracle Academy
Use Only

Objectives

After completing this lesson, you should be able to:

- Explain the role of task properties
- Use task properties in task steps
- Configure queries in task steps
- Configure an instance identifier for the user inbox
- Configure a subtask
- Use the task debugger to examine task properties

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task Properties

- Are variables that store data used by or produced by task steps
 - Data persists while the task is executing
- Can be used to pass values:
 - Between steps in a task
 - To and from a business service
 - To and from a subtask
- Can provide values for use in:
 - Decision point steps
 - Expressions such as search specifications used in Siebel operation steps

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task Properties

Task Properties

Task properties play the same role that process properties play in workflow processes.

Reference

Reference Materials for Siebel Task UI” in *Siebel Business Process Framework: Task UI Guide*

System Task Properties

- Each task, by default, has a set of system task properties
- View the task properties for a task in the multi value property window (MVPW)
 - If necessary, click the Task Properties tab
 - Make sure that no task step has been selected

The screenshot shows the Siebel System Task Properties window. At the top, there is a tab bar with 'Task List' and 'Task - AUT Create New Contact - 2'. Below the tabs is a workflow diagram with four steps: 'Start' (blue parallelogram), 'Create Contact' (pink rectangle), 'AUT Create Contact View' (green oval), and 'Add Service Request' (pink rectangle). Below the diagram is the 'Multi Value Property Window' with a tab bar showing 'Task Properties', 'Event Handlers', 'Task Metrics', 'Task Locales', and 'Chapters'. The 'Task Properties' tab is selected, showing a table of properties for the task 'Children of AUT Create New Contact: 2'.

Name	Data Type	Default	Access Mode	In/Out
Context BC Id	String		R/W	None
Context BC Name	String		R/W	None
Context BO Name	String		R/W	None
Error Code	String		R/W	None
Error Message	String		R/W	None
Instance Identifier	String		R/W	None
Object Id	String		R/W	None
Siebel Operation Object Id	String		R/W	None

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

System Task Properties

Several of the task properties (Object Id, Siebel Operation Object Id, Error Code, and Error Message) are the same as the corresponding process properties for Siebel workflow processes. The remaining task properties are specific to tasks.

Task Property is a child object type of Task and appears in the MVPW when the task itself is selected. If another item such as Task View Step or Decision Point step is selected, a different set of child properties appear in the MVPW.

Configuration Involving Task Properties

- Some tasks may require configuration of task properties:
 - Using and storing values of transient business component fields
 - Creating search specifications for task steps
 - Configuring contextual tasks
 - Creating an instance identifier for display in the task inbox
 - Configuring a subtask

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Configuration Involving Task Properties

Many tasks can be created without the need to create or refer to task properties. This is in contrast to creating workflow processes which typically involve creating and using workflow process properties.

Transient Business Component Data

- Can be manipulated in a task view step that includes a task applet based on the TBC
- Can be directly accessed in conditions for decision point steps
- Must first be assigned to task properties before:
 - Being assigned to standard business component fields
 - Required if some transient data needs to be stored persistently
 - Being referenced in expressions

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Transient Business Component Data

Data in a task property can also be considered transient. However, data in a TBC can be directly presented in the UI while task property data cannot. This difference is a factor when deciding whether to store transient data in a TBC or in a task property.

Using Transient Business Component Data

The steps to use transient business component data are:

1. Create additional task properties
2. Assign TBC data to task properties
3. Assign task properties to input arguments

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Using Transient Business Component Data

Reference

“Reference Materials for Siebel Task UI” in *Siebel Business Process Framework: Task UI Guide*

1. Create Additional Task Properties

- Invoke the Task Designer for the task
- Click the Task Properties tab in the MVPW
- Create custom task properties to correspond to each TBC field that needs to be processed
 - Specify the data type, access mode, and In/Out properties

Multi Value Property Window					
Children of ATL Contact Quick Create: 2					
Task Properties Event Handlers Task Metrics Task Locales Chapters					
Name	Data Type	Default	Access Mode	In/Out	
Object Id	String		R/W	None	
Siebel Operation Object Id	String		R/W	None	
vContactId	String		R/W	None	
vContactMethod	String		R/W	None	
vEmailAddress	String		R/W	None	
vFirstName	String		R/W	None	
vHomePhone	String		R/W	None	
vLastName	String		R/W	None	
vMF	String		R/W	None	
vMM	String		R/W	None	
vMiddleName	String		R/W	None	
vMobilePhone	String		R/W	None	

Custom task properties specific to this task

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

1. Create Additional Task Properties

The In/Out property defaults to none for a new task property. You can change it to In, Out, or In/Out if you need to pass data into or out of the task. This does not typically occur for tasks that are invoked directly by a user.

2. Assign TBC Data to Task Properties

- Select the task view step that includes a task applet
- Create output arguments for each field to be assigned
 - Click the Output Arguments tab in the MVPW
 - Select the task property and specify the source business component and field

The screenshot shows a task flow diagram with the following steps: Start (blue parallelogram) → ADS HRZ Create Contact General Info (green rounded rectangle) → ADS HRZ Contact List TaskView (green rounded rectangle) → Use and Existing Contact or Create? (yellow diamond) → Create Contact (pink rounded rectangle). The 'ADS HRZ Create Contact General Info' step is highlighted with a red box.

Below the flow is the 'Multi Value Property Window' (MVPW) for 'Task View 0'. It has tabs for 'Input Arguments', 'Output Arguments', 'Task Step Context', and 'Task View Step Locales'. The 'Output Arguments' tab is active, showing a table with the following data:

Property Name	Type	Value	Output Argument	Business Component	Business Component Field
vContactMethod	Business Component			ADS HRZ Contact Quick Create TBC	Contact Method
vEmailAddress	Business Component			ADS HRZ Contact Quick Create TBC	Email Address
vFirstName	Business Component			ADS HRZ Contact Quick Create TBC	First Name
vHomePhone	Business Component			ADS HRZ Contact Quick Create TBC	Home Phone
vLastName	Business Component			ADS HRZ Contact Quick Create TBC	Last Name

Two yellow callout boxes provide additional context:

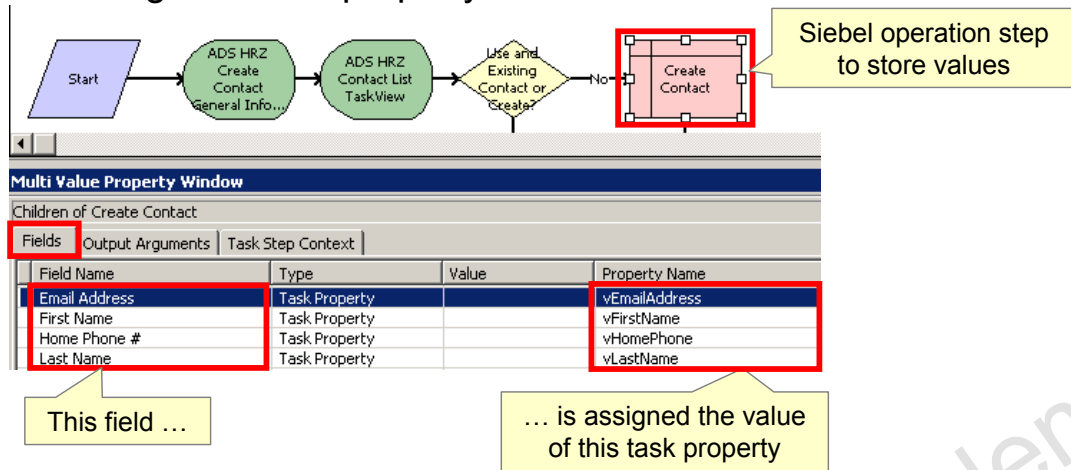

- A box pointing to the 'vContactMethod' row: "Task property..."
- A box pointing to the 'Contact Method' field: "... is assigned the value in this field in this business component"

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

3. Assign Task Properties to Input Arguments

- A value in a task property can be stored persistently by assigning it as an input to a Siebel operation step
 - Select the Siebel operation step
 - Click the Fields tab in the MVPW
 - Assign the task property to the desired field

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Search Specifications in Tasks

- Some tasks may include a task step in which a set of records is retrieved and displayed
 - Involves creating a search specification

The screenshot shows a Siebel Business Automation interface. On the left, a 'Current Task' pane displays a task list with 'Display Service Requests' selected. The main area is titled 'Call Resolution Start to Finish: Display Service Requests' and contains a table of service requests. A callout box points to the table with the text: 'Task view that displays all service requests for a contact'.

Current Task x

Call Resolution Start to Finish

- ▶ Verify Contact Information
- ▼ Identify Service Request
 - Is this Regarding an Existing Issue?
 - **Display Service Requests**

Call Resolution Start to Finish: Display Service Requests

Pause Previous Next Cancel

Service Requests 1 - 2 of 2

New	SR #	Account	Last Name	Owner	Area
>	410194-12249814		Bear	DDEV	
	410194-12249966		Bear	DDEV	

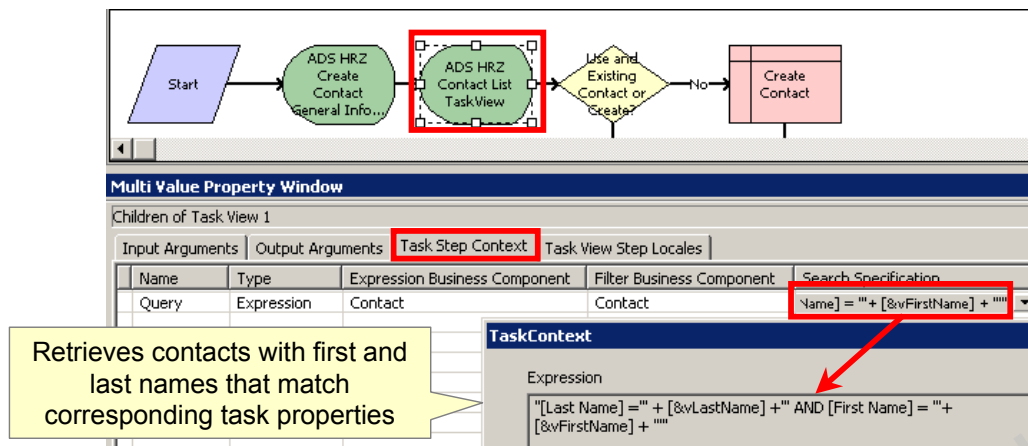

Task view that displays all service requests for a contact

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task Step Context

- Is a child object type of task step used to specify a search specification
 - Includes an expression based on literals, field values, and task property values
- Can be created for task views and Siebel operation steps

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Task Step Context

Reference

“Building a Task UI” in *Siebel Business Process Framework: Task UI Guide*

Creating a Search Specification

- Select the task view or Siebel operation step
- Click the Task Step Context tab in the MVPW
- Create a new record and assign properties

Specifies the BC being queried (fields on left side of expression)

Literal or expression

Specifies the BC whose fields might be referenced in the right side of the expression

Uses similar syntax to refer to task properties as is used for workflow processes

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Contextual Tasks

- Several system properties are populated automatically when a contextual task is invoked
 - Object Id and Context BC Id are populated with the Row Id of the context record
 - Passes in the record to the task
 - Populates the fields of the primary business component

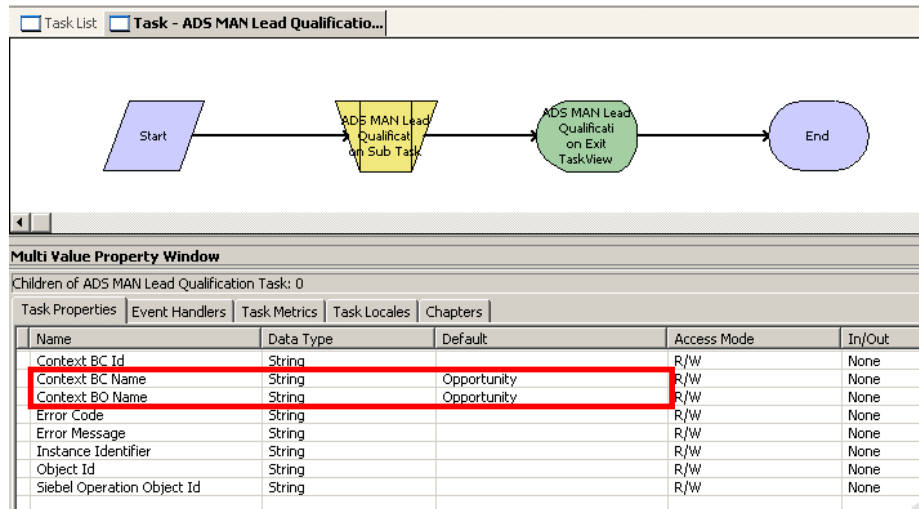

The screenshot displays the Siebel CRM interface. On the left, a 'Tasks' pane shows a tree view with 'Call Resolution Start to Finish' selected and highlighted by a red box. A yellow callout box labeled 'Contextual task' points to this selection. An arrow points from the 'Call Resolution Start to Finish' task to the 'Current Task' pane. The 'Current Task' pane shows a 'Verify Account Information' task. The main window displays a form for 'George Abby' with fields for Last Name, First Name, Work #, Main Fax #, Job Title, Mobile Phone #, Mr/Ms, and Email. The 'Verify Account Information' task form includes fields for First Name, Last Name, Title, Account, Email Address, Work Phone #, Street Address, City, State, Zip, and Site. The 'Verify Account Information' task is currently active, and the 'Call Resolution Start to Finish' task is the current task.

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Configuring a Contextual Task

- Specify values for the Context BC Name and Context BO Name task properties to identify the context for the task
 - Can be omitted if the task is invoked only from views in which the task business object = view business object

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Configuring a Contextual Task

Context for the Task

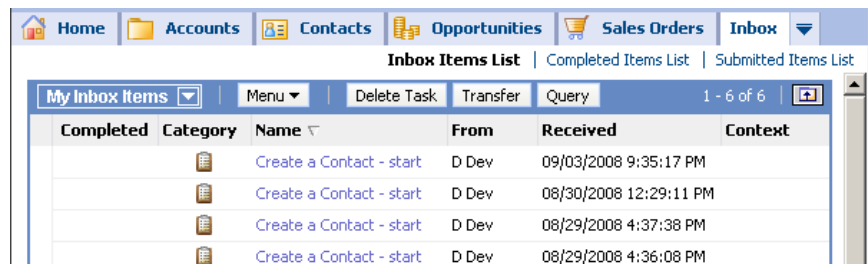

The context for the task refers to the business component that is passed into the task when a contextual task is invoked.

Reference

“Siebel Task UI Interface Elements” in *Siebel Business Process Framework: Task UI Guide*

Resuming Tasks from the Inbox

- Tasks can be paused and then resumed from the universal inbox
- By default tasks are identified by the task name
 - May be hard to identify the desired instance to resume

The screenshot shows the Siebel Universal Inbox interface. At the top, there is a navigation bar with tabs for Home, Accounts, Contacts, Opportunities, Sales Orders, and Inbox. Below the navigation bar, there are tabs for 'Inbox Items List', 'Completed Items List', and 'Submitted Items List'. The 'Inbox Items List' tab is active, showing a table of tasks. The table has columns for 'Completed', 'Category', 'Name', 'From', 'Received', and 'Context'. There are four rows of tasks, all with the name 'Create a Contact - start' and 'D Dev' as the sender. The 'Received' column shows timestamps: 09/03/2008 9:35:17 PM, 08/30/2008 12:29:11 PM, 08/29/2008 4:37:38 PM, and 08/29/2008 4:36:08 PM. Above the table, there is a search bar with 'My Inbox Items' and a 'Query' button. To the right of the search bar, it says '1 - 6 of 6'.

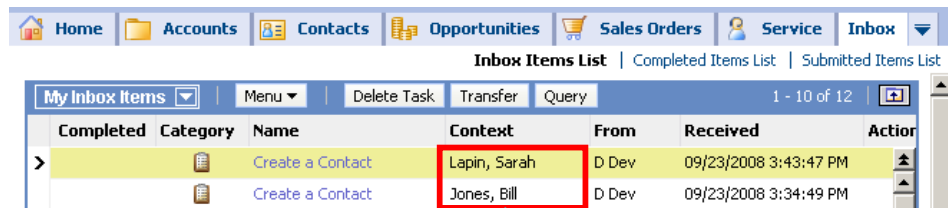

Completed	Category	Name	From	Received	Context
		Create a Contact - start	D Dev	09/03/2008 9:35:17 PM	
		Create a Contact - start	D Dev	08/30/2008 12:29:11 PM	
		Create a Contact - start	D Dev	08/29/2008 4:37:38 PM	
		Create a Contact - start	D Dev	08/29/2008 4:36:08 PM	

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Inbox Context Field

- Is a field in an inbox record that can be used to distinguish among multiple-paused instances of a given task
- Can be populated with instance-specific data such as:
 - Name
 - Timestamp

The screenshot shows the Siebel 'Inbox Items List' interface. It features a navigation bar with tabs for Home, Accounts, Contacts, Opportunities, Sales Orders, Service, and Inbox. Below the navigation bar, there are links for 'Inbox Items List', 'Completed Items List', and 'Submitted Items List'. The main table has columns: Completed, Category, Name, Context, From, Received, and Action. Two rows are visible, both with the name 'Create a Contact'. The 'Context' column for the first row is 'Lapin, Sarah' and for the second row is 'Jones, Bill'. Both 'Context' cells are highlighted with a red border.

Completed	Category	Name	Context	From	Received	Action
>		Create a Contact	Lapin, Sarah	D Dev	09/23/2008 3:43:47 PM	
		Create a Contact	Jones, Bill	D Dev	09/23/2008 3:34:49 PM	

Instance identifier
to distinguish the
paused tasks

ORACLE

Inbox Context Field

Reference

“Building a Task UI” in *Siebel Business Process Framework: Task UI Guide*

Configuring an Instance Identifier

- Select an early step in the task
 - Must be of a type that allows output arguments to be assigned
- Click the Output Arguments tab
- Create a record to assign a value to the Instance Identifier task property
 - Assign an expression or business component field

Multi Value Property Window

Children of Create Contact

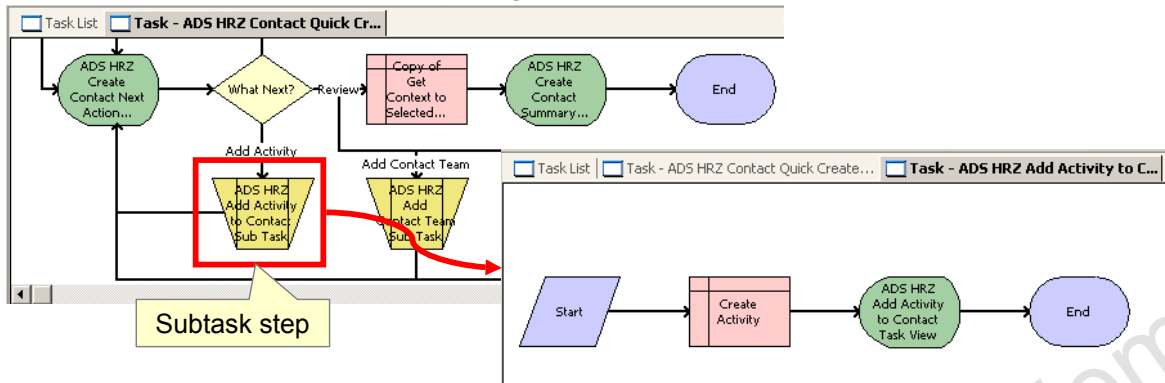

Property Name	Type	Value	Output Argument	Business Component	Business Component Field
Instance Identifier	Business Component			Contact	Last Name, First Name
vContactId	Business Component			Contact	Id

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Subtask

- Is a separately configured task that
 - Is invoked as part of another task
 - Cannot be invoked by itself
- Allows a large task to be partitioned into smaller tasks that
 - May be easier to develop and maintain
 - Can be shared among different parent tasks

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Subtask

Reference

Defining Steps and Connectors” in *Siebel Business Process Framework: Task UI Guide*

Characteristics of Subtasks

- A subtask:
 - Participates in the same task transaction
 - Has access to business component fields in the parent task
 - Must be based on the same business object
 - Has its own set of task properties
 - Can contain a subtask

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Characteristics of Subtasks

Task Transaction

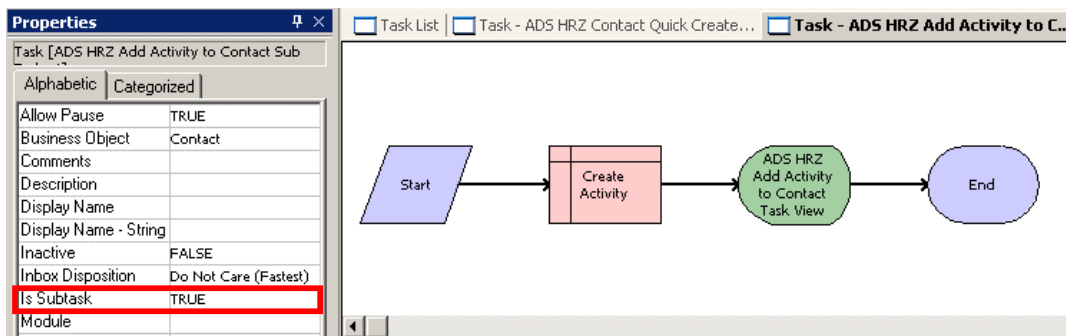

A Task Transaction refers to the set of persistent and transient data associated with the task instance while the task is executing or paused. It represents the data that has not yet been stored in the regular Siebel database tables.

Executing a Subtask

Invocation of a subtask is transparent to the user; the user receives no indication that a subtask has just been invoked or completed. In addition a user can navigate backwards, using the previous button from a subtask to a parent task.

Configuring a Subtask

- A subtask:
 - Is created in the same way as a task
 - Check Create as a subtask in the New task wizard
 - Is Subtask flag cannot be changed once a task or subtask is created
 - Is published and activated in the same way as a task
 - Subtasks need to be published before the parent task

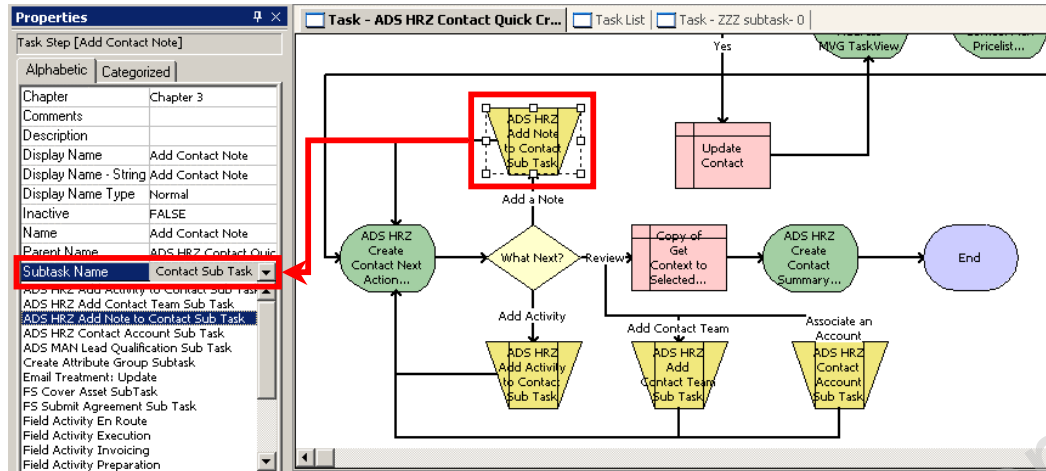

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Adding a Subtask Step

- Add a subtask step to the task
- Specify a display name for the step
- Assign a subtask
 - Select from the list of subtasks in the drop-down list

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Adding a Subtask Step

Subtask steps have input and output arguments that you can configure, if required, to pass data into or receive data from a subtask. This is required if you wish to make task properties in the parent task available to the subtask, or make output arguments of the subtask available to the parent task.

Task Debugger

- Siebel clients include a task debugger to assist developers in testing tasks
 - Provides a watch window that displays values of task properties and business component fields

Name	Value	Type
Task: ADS Call Resolution Start to Finish(v1)		
Context BC Id	8SIA-7AGZZ	String
Object Id	8SIA-7AGZZ	String
Siebel Operation Object Id		String

Task Debugger

Reference

“Testing and Troubleshooting a Task UI” in *Siebel Business Process Framework: Task UI Guide*

Enabling the Task Debugger

- Adds a Debug Mode item to the Tools menu in a Siebel client
 - For the Siebel Developer Web client:
 - Edit the application configuration file
 - Add, if necessary, a parameter called EnableRestrictedMenu
 - Set it to TRUE
 - For the Siebel Web client:
 - Select the Siebel server in the server configuration administration screen
 - Select the application object manager
 - Set the EnableRestrictedMenu parameter to TRUE

```
uagent.cfg - Notepad
File Edit Format View Help

[InfraUIFramework]
EnableRestrictedMenu = TRUE
ShowScreenTabIcon = TRUE
```

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

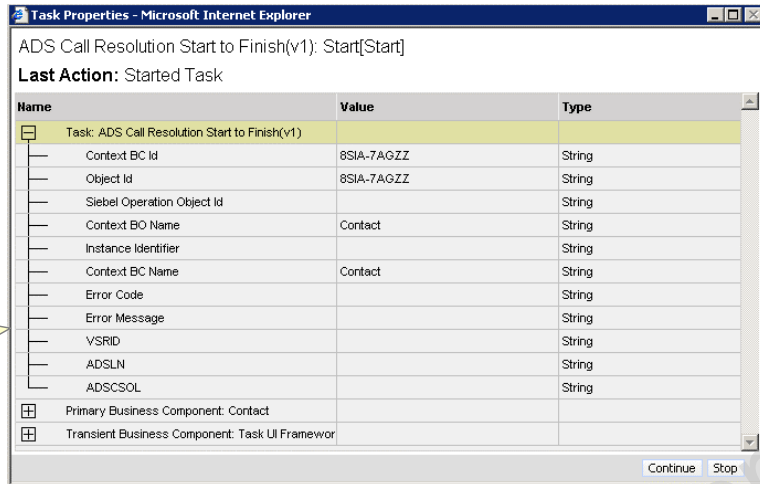

Using the Task Debugger

- In the Siebel Client, select Tools > Debug Mode
- Invoke a task as usual
 - The watch window appears and displays properties upon completion of the start step

When Debug mode is enabled

... the task debugger appears when a task executes

ORACLE

Copyright © 2010, Oracle and/or its affiliates. All rights reserved.

Examining Task Properties

- Click Continue to advance through the task
 - A task view is displayed whenever a task view step occurs
- Examine the contents of the watch window
